(54) Title: NOVEL G PROTEIN-COUPLED RECEPTOR

## (57) Abstract

The present invention is directed to novel G protein-coupled receptors that are found predominantly in the dorsal root ganglia. The invention encompasses both receptor proteins as well as nucleic acids encoding the proteins. Angiotension I and III effects Calcium signalling in Cells transformed with DNA encoding the receptor. In addition, the present invention is directed to methods and compositions which utilize the receptors.

## NOVEL G PROTEIN-COUPLED RECEPTOR

Field of the Invention

The present invention is in the general field of biological receptors and the various uses  
5 that can be made of such receptors. More specifically, the invention relates to nucleic acids  
encoding novel G protein-coupled receptors and to the receptors per se.

Background and Prior Art

10 G protein-coupled receptors (GPCRs) constitute a family of proteins sharing a common  
structural organization characterized by an extracellular N-terminal end, seven hydrophobic  
alpha helices putatively constituting transmembrane domains and an intracellular C-  
terminal domain. GPCRs bind a wide variety of ligands that trigger intracellular signals  
through the activation of transducing G proteins (*Caron, et al., Rec. Prog. Horm. Res.*  
48:277-290 (1993); *Freedman et al., Rec. Prog. Horm. Res.* 51:319-353 (1996)).

15

More than 300 GPCRs have been cloned thus far and it is generally assumed that there  
exist well over 1000 such receptors. Mechanistically, approximately 50-60% of all  
clinically relevant drugs act by modulating the functions of various GPCRs (*Cudermann, et*  
*al., J. Mol. Med.* 73:51-63 (1995)). Of particular interest are receptors located in dorsal root  
20 ganglia. This region of the central nervous system is densely innervated with primary or  
afferent sensory neurons involved in the transmission, modulation and sensation of pain.  
Thus, receptors from this region may be used in assays for the identification of new agents  
for anesthesia and analgesia

25 Summary of the Invention

The present invention is based upon the discovery of a novel G protein-coupled receptor  
which is distinct from previously reported receptors in terms of structure and in being  
expressed preferentially in dorsal root ganglia. One dorsal root receptor (DRR) has been  
isolated and sequenced from the rat and six from the human. The rat receptor was given the

designation rDRR-1 and its amino acid sequence is shown as SEQ ID NO:1. The human receptors were designated as

hDRR-1 (SEQ ID NO:3);

hDRR-2 (SEQ ID NO:5);

5 hDRR-3 (SEQ ID NO:7);

hDRR-4 (SEQ ID NO:9);

hDRR-5 (SEQ ID NO:11); and

hDRR-6 (SEQ ID NO:13).

Unless otherwise specified, the term "DRR" as used herein refers to all of the receptors  
10 from both human and rat.

In its first aspect, the invention is directed to proteins, except as existing in nature, comprising the amino acid sequence consisting functionally of a rat or human DRR as shown in SEQ ID NO:1, 3, 5, 7, 9, 11, or 13. The term "consisting functionally of" is  
15 intended to include any receptor protein whose sequence has undergone additions, deletions or substitutions which do not substantially alter the functional characteristics of the receptor. Thus, the invention encompasses proteins having exactly the same amino acid sequence as shown in the sequence listing, as well as proteins with differences that are not substantial as evidenced by their retaining the basic, qualitative binding properties of  
20 the DRR receptor. The invention further encompasses substantially pure proteins consisting essentially of a DRR amino acid sequence, antibodies that bind specifically to a DRR (i.e. that have at least a 100 fold greater affinity for the DRR than any other naturally occurring non-DRR protein), and antibodies made by a process involving the injection of pharmaceutically acceptable preparations of such proteins into an animal capable of  
25 antibody production. In a preferred embodiment, monoclonal antibody to human or rat DRR is produced by injecting a pharmaceutically acceptable preparation of the receptor into a mouse and then fusing mouse spleen cells with myeloma cells.

The invention is also directed to a substantially pure polynucleotide encoding a protein  
30 comprising the amino acid sequence consisting functionally of the sequence of rat DRR (as

shown in SEQ ID NO:1) or a human DRR (as shown in SEQ ID NOs 3, 5, 7, 9, 11 or 13). This aspect of the invention encompasses polynucleotides encoding proteins consisting essentially of the amino acid sequences shown in the sequence listing, expression vectors comprising such polynucleotides, and host cells transformed with such vectors. Also 5 included are the recombinant rat and human DRR proteins produced by host cells made in this manner.

Preferably, the polynucleotide encoding rat DRR has the nucleotide sequence shown in SEQ ID NO:2 and the polynucleotide encoding a human DRR has the nucleotide sequence 10 shown in SEQ ID NO: 3, 5, 7, 9, 11 or 13. It is also preferred that the vectors and host cells used for the expression of DRR contain these particular polynucleotides.

In another aspect, the present invention is directed to a method for assaying a test compound for its ability to bind to a rat or human DRR. The method is performed by 15 incubating a source of DRR with a ligand known to bind to the receptor and with the test compound. The source of the DRR should be substantially free of other types of G protein-coupled receptors, i.e. greater than 85% of such receptors present should correspond to the DRR. Upon completion of incubation, the ability of the test compound to bind to the DRR is determined by the extent to which ligand binding has been displaced. The rat DRR 20 should, preferably correspond to rDRR-1 as shown in SEQ ID NO:1. The human receptor should preferably be hDRR-1 (SEQ ID NO:3); hDRR-2 (SEQ ID NO:5); hDRR-3 (SEQ ID NO:7); hDRR-4 (SEQ ID NO:9); hDRR-5 (SEQ ID NO:11); or hDRR-6 (SEQ ID NO:13). Either transformed cells expressing recombinant DRR may be used in the assays or 25 membranes can be prepared from the cells and used. Although not essential, the assay can be accompanied by the determination of the activation of a second messenger pathway such as the adenyl cyclase pathway. This should help to determine whether a compound that binds to DRR is acting as an agonist or antagonist.

An alternative method for determining if a test compound is an agonist of any of the 30 DRRs disclosed herein is to use a cell signaling assay, e.g., an assay measuring either

intracellular adenyl cyclase activity or intracellular calcium concentration. The test compound is incubated with cells expressing the DRR but substantially free of other G protein-coupled receptors, typically a cell transfected with an expression vector encoding the DRR. Test compounds that are agonists are identified by their causing a statistically significant change in the results obtained from the cell signaling assay when compared to control transfectants not exposed to test compound. For example, the cells exposed to the test compound may show a significant increase in adenyl cyclase activity or in intracellular calcium concentration.

10 The invention also encompasses a method for determining if a test compound is an antagonist of a DRR which relies upon the known activation of G protein-coupled receptors that occurs when such receptors are expressed in large amounts. This method requires that DNA encoding the receptor be incorporated into an expression vector so that it is operably linked to a promoter and that the vector then be used to transfect an appropriate host. In order to produce sufficient receptor to result in constitutive receptor activation (i.e., activation in the absence of natural ligand), expression systems capable of copious protein production are preferred, e.g., the DRR DNA may be operably linked to a CMV promoter and expressed in COS or HEK293 cells. After transfection, cells with activated receptors are selected based upon their showing increased activity in a cell signaling assay relative to comparable cells that have either not been transfected or that have been transfected with a vector that is incapable of expressing functional DRR. Typically, cells will be selected either because they show a statistically significant increase in intracellular adenyl cyclase activity or a statistically significant increase in intracellular calcium concentration. The selected cells are contacted with the test compound and the cell signaling assay is repeated to determine if this results in a decrease in activity relative to control cells not contacted with the test compound. For example, a statistically significant decrease in either adenyl cyclase activity or calcium concentration relative to control cells would indicate that the test compound is an antagonist of the DRR. Any of the DRRs disclosed herein may be used in these assays.

Assays for compounds interacting with a DRR may be performed by incubating a source containing the DRR but substantially free of other G protein-coupled receptors (e.g. a stably transformed cell) with angiotensin II or III in both the presence and absence of test compound and measuring the modulation of intracellular calcium concentration. A

5 significant increase or decrease in angiotensin-stimulated calcium displacement in response to test compound is indicative of an interaction occurring at the DRR. The receptors that may be used in these assays include rat DRR-1 and human DRR-1, DRR-2, DRR-3, DRR-4, DRR-5 and DRR-6.

10 In another aspect, the present invention is directed to a method for assaying a test compound for its ability to alter the expression of a rat or human DRR. This method is performed by growing cells expressing the DRR, but substantially free of other G protein-coupled receptors, in the presence of the test compound. Cells are then collected and the expression of the DRR is compared with expression in control cells grown under 15 essentially identical conditions but in the absence of the test compound. The rat receptor is preferably rDRR-1 and the human receptor may be DRR-1; DRR-2; DRR-3; DRR-4; DRR-5; or DRR-6.

20 A preferred test compound is an oligonucleotide at least 15 nucleotides in length comprising a sequence complimentary to the sequence of the DRR used in the assay.

Brief Description of the Drawings

Figure 1. Nucleotide sequence of rDRR-1: Clone 3B-32, encoding rDRR-1, was isolated from a rat genomic library using the Promoter Finder Walking Kit (see Methods, Clontech).

5

The cloned gene was deposited with the international depositary authority Deutsche Sammlung Von Mikroorganismen Und Zellkulturen GmbH at the address Mascheroder Weg 1 B, D-3300 Braunschweig, Germany. The deposit was made on November 27, 1997 and was given the accession number DSM 11877.

10

Figure 2. Deduced amino acid sequence of DRR-1: Clone 3B-32 codes for a 337 amino acid protein. The amino acid sequence begins with the first ATG in the nucleotide sequence.

15

Figure 3. Alignment of the deduced amino acid sequences of clone 3B-32 (rDRR-1) with its five most homologous sequences. The boxed and shaded residues are the ones that are identical to the rDRR-1 sequence.

20

Figure 4. Amino acid alignment of the human DRR homologs: The amino acid sequence of all 6 human homologs of rDRR-1 (hDRR-1; hDRR-2; hDRR-3; hDRR-4; hDRR-5; and hDRR-6) are aligned. The amino acid residues differing from the clone 36 (HUMAN36.PR) are boxed. The degree of identity among these sequences ranges from 77% to almost 100%.

25

Definitions

The description that follows uses a number of terms that refer to recombinant DNA technology. In order to provide a clear and consistent understanding of the specification and claims, including the scope to be given such terms, the following definitions are provided.

30

**Cloning vector:** A plasmid or phage DNA or other DNA sequence which is able to replicate autonomously in a host cell, and which is characterized by one or a small number of restriction endonuclease recognition sites. A foreign DNA fragment may be spliced into the vector at these sites in order to bring about the replication and cloning of the fragment.

5 The vector may contain a marker suitable for use in the identification of transformed cells. For example, markers may provide tetracycline resistance or ampicillin resistance.

**Expression vector:** A vector similar to a cloning vector but which is capable of inducing the expression of the DNA that has been cloned into it, after transformation into a host.

10 The cloned DNA is usually placed under the control of (i.e., operably linked to) certain regulatory sequences such as promoters or enhancers. Promoter sequences may be constitutive, inducible or repressible.

**Substantially pure:** As used herein, "substantially pure" means that the desired product is essentially free from contaminating cellular components. A "substantially pure" protein or nucleic acid will typically comprise at least 85% of a sample, with greater percentages being preferred. Contaminants may include proteins, carbohydrates or lipids. One method for determining the purity of a protein or nucleic acid is by electrophoresing a preparation in a matrix such as polyacrylamide or agarose. Purity is evidenced by the appearance of a 20 single band after staining. Other methods for assessing purity include chromatography and analytical centrifugation.

**Host:** Any prokaryotic or eukaryotic cell that is the recipient of a replicable expression vector or cloning vector is the "host" for that vector. The term encompasses prokaryotic or 25 eukaryotic cells that have been engineered to incorporate a desired gene on its chromosome or in its genome. Examples of cells that can serve as hosts are well known in the art, as are techniques for cellular transformation (see e.g. Sambrook et al., Molecular Cloning: A Laboratory Manual, 2nd ed. Cold Spring Harbor (1989)).

30 **Promoter:** A DNA sequence typically found in the 5' region of a gene, located proximal

to the start codon. Transcription is initiated at the promoter. If the promoter is of the inducible type, then the rate of transcription increases in response to an inducing agent.

**Complementary Nucleotide Sequence:** A complementary nucleotide sequence, as used herein, refers to the sequence that would arise by normal base pairing. For example, the nucleotide sequence 5'-AGAC-3' would have the complementary sequence 5'-GTCT-3'.

**Expression:** Expression is the process by which a polypeptide is produced from DNA. The process involves the transcription of the gene into mRNA and the translation of this mRNA into a polypeptide.

#### Detailed Description of the Invention

The present invention is directed to DRR receptor proteins, genetic sequences coding for the receptors, a method for assaying compounds for binding to DRR receptors and a method for assaying compounds for their ability to alter DRR expression. The receptors and their nucleic acids are defined by their structures (as shown in figures 1, 2 and 4; and SEQ ID numbers 1-14).

It will be understood that the present invention encompasses not only sequences identical to those shown in the figures and sequence listing, but also sequences that are essentially the same and sequences that are otherwise substantially the same and which result in a receptor retaining the basic binding characteristics of the DRR. For example, it is well known that techniques such as site-directed mutagenesis may be used to introduce variations in a protein's structure. Variations in a DRR protein introduced by this or some similar method are encompassed by the invention provided that the resulting receptor retains the basic qualitative binding characteristics of the unaltered DRR. Thus, the invention relates to proteins comprising amino acid sequences consisting functionally of the sequence of SEQ ID NO:1 (rat) and SEQ ID numbers 3, 5, 7, 9, 11 and 14 (human).

### I. Nucleic Acid Sequences Coding for DRR

DNA sequences coding for DRRs are expressed exclusively, or at least highly preferentially, in dorsal root ganglia and these ganglia may serve as a source for the isolation of nucleic acids coding for the receptors. In addition, cells and cell lines that 5 express a rat or human DRR may serve as a source for nucleic acid. These may either be cultured cells that have not undergone transformation or cell lines specifically engineered to express recombinant DRR.

In all cases, poly A+ mRNA is isolated from the dorsal root ganglia, reverse transcribed 10 and cloned. The cDNA library thus formed may then be screened using probes derived from the sequences shown in the accompanying sequence listing as SEQ ID number 2, 4, 6, 8, 10, 12 or 14, depending upon the particular DRR being isolated. Probes should typically be at least 14 bases in length and should be derived from a portion of the DRR sequence 15 that is poorly conserved (see Figures 3 and 4). Screening can also be performed using genomic libraries with one DRR gene, or a portion of the gene, serving as a probe in the isolation of other DRR genes. For example, full length rDRR-1 may be labeled and used to screen a human genomic library for the isolation of hDRR-1, hDRR-2 etc. (see Examples section).

20 Alternatively genomic DNA libraries can be used to isolate DRR genes by performing PCR amplifications with primers located at either end of genes (see Examples section for a description of procedures). For example, human genomic DNA may be amplified using the primers:

25 5'-GCAAGCTTCTGAGCATGGATCCAACCGTC, and  
5'-CCCTCAGATCTCCAATTGCTTCCGACAG.

This will serve to amplify all six of the human DRR genes identified herein as hDRR-1; hDRR-2; hDRR-3; hDRR-4; hDRR-5; and hDRR-6. These may then be cloned into an appropriate vector, e.g. pGEM-T (Promega), for DNA sequence analysis.

5    **II. Antibodies to Rat and Human DRRs**

The present invention is also directed to antibodies that bind specifically to a rat or human DRR and to a process for producing such antibodies. Antibodies that "bind specifically to a DRR" are defined as those that have at least a one hundred fold greater affinity for the DRR than for any other protein. The process for producing such antibodies may involve 10 either injecting the DRR protein itself into an appropriate animal or, preferably, injecting short peptides made to correspond to different regions of the DRR. The peptides should be at least five amino acids in length and should be selected from regions believed to be unique to the particular DRR protein being targeted. Thus, highly conserved transmembrane regions should generally be avoided in selecting peptides for the generation 15 of antibodies. Methods for making and detecting antibodies are well known to those of skill in the art as evidenced by standard reference works such as: (*Harlow et al., Antibodies, A Laboratory Manual, Cold Spring Harbor Laboratory, N.Y. (1988)*); *Klein, Immunology: The Science of Self-Nonself Discrimination (1982)*; *Kennett, et al., Monoclonal Antibodies and Hybridomas: A New Dimension in Biological Analyses (1980)*; 20 and *Campbell, "Monoclonal Antibody Technology," in Laboratory Techniques in Biochemistry and Molecular Biology, (1984)*).

"Antibody," as used herein, is meant to include intact molecules as well as fragments which retain their ability to bind to antigen (e.g., Fab and F(ab)2 fragments). These fragments are 25 typically produced by proteolytically cleaving intact antibodies using enzymes such as papain (to produce Fab fragments) or pepsin (to produce F(ab)2 fragments). The term "antibody" also refers to both monoclonal antibodies and polyclonal antibodies. Polyclonal antibodies are derived from the sera of animals immunized with the antigen. Monoclonal antibodies can be prepared using hybridoma technology (*Kohler, et al., Nature 256:495 (1975)*; *Hammerling, et al., in: Monoclonal Antibodies and T-Cell Hybridomas. Elsevier, 30*

*M.Y., pp. 563-681 (1981)).* In general, this technology involves immunizing an animal, usually a mouse, with either intact DRR or a fragment derived from the DRR. The splenocytes of the immunized animals are extracted and fused with suitable myeloma cells, e.g., SP2O cells. After fusion, the resulting hybridoma cells are selectively maintained in 5 HAT medium and then cloned by limiting dilution (Wands, et al., *Gastroenterology* 80:225-232 (1981)). The cells obtained through such selection are then assayed to identify clones which secrete antibodies capable of binding to the DRR.

The antibodies, or fragments of antibodies, of the present invention may be used to detect 10 the presence of DRR protein using any of a variety of immunoassays. For example, the antibodies may be used in radioimmunoassays or in immunometric assays, also known as "two-site" or "sandwich" assays (see Chard, T., *"An Introduction to Radioimmune Assay and Related Techniques," in Laboratory Techniques in Biochemistry and Molecular Biology, North Holland Publishing Co., N.Y. (1978)). In a typical immunometric assay, a 15 quantity of unlabeled antibody is bound to a solid support that is insoluble in the fluid being tested, e.g., blood, lymph, cellular extracts, etc. After the initial binding of antigen to immobilized antibody, a quantity of detectably labeled second antibody (which may or may not be the same as the first) is added to permit detection and/or quantitation of bound antigen (see e.g. Radioimmune Assay Method, Kirkham et al., ed., pp. 199-206. E & S. 20 Livingstone, Edinburgh (1970)). Many variations of these types of assays are known in the art and may be employed for the detection of the DRR.*

Antibodies to a rat or human DRR may also be used in the purification of either the intact receptor or fragments of the receptor (see generally, Dean et al., *Affinity Chromatography, A Practical Approach, IRL Press (1986)).* Typically, antibody is immobilized on a chromatographic matrix such as Sepharose 4B. The matrix is then packed into a column and the preparation containing the DRR desired is passed through under conditions that promote binding, e.g., under conditions of low salt. The column is then washed and bound DRR is eluted using a buffer that promotes dissociation from antibody, e.g., buffer having

an altered pH or salt concentration. The eluted DRR may be transferred into a buffer of choice, e.g., by dialysis, and either stored or used directly.

### III. Radioligand Assay for Receptor Binding

5 One of the main uses for DRR nucleic acids and recombinant proteins is in assays designed to identify agents capable of binding to DRR receptors. Such agents may either be agonists, mimicking the normal effects of receptor binding, or antagonists, inhibiting the normal effects of receptor binding. Of particular interest is the identification of agents which bind to the DRR and modulate adenyl cyclase activity in the cells. These agents have 10 potential therapeutic application as either analgesics or anesthetics.

In radioligand binding assays, a source of DRR is incubated together with a ligand known to bind to the receptor and with the compound being tested for binding activity. The preferred source for DRR is cells, preferably mammalian cells, transformed to recombinantly express the receptor. The cells selected should not express a substantial 15 amount of any other G protein-coupled receptors that might bind to ligand and distort results. This can easily be determined by performing binding assays on cells derived from the same tissue or cell line as those recombinantly expressing DRR but which have not undergone transformation.

20 The assay may be performed either with intact cells or with membranes prepared from the cells (see e.g. Wang, et al., *Proc. Natl. Acad. Sci. U.S.A.* 90:10230-10234 (1993)). The membranes are incubated with a ligand specific for the DRR receptor and with a preparation of the compound being tested. After binding is complete, receptor is separated 25 from the solution containing ligand and test compound, e.g. by filtration, and the amount of binding that has occurred is determined. Preferably, the ligand used is detectably labeled with a radioisotope such as  $^{125}\text{I}$ . However, if desired, fluorescent or chemiluminescent labels can be used instead. Among the most commonly used fluorescent labeling compounds are fluorescein isothiocyanate, rhodamine, phycoerythrin, phycocyanin, allophycocyanin, o-phthaldehyde and fluorescamine. Useful chemiluminescent compounds 30 include luminol, isoluminol, theromatic acridinium ester, imidazole, acridinium salt, and

oxalate ester. Any of these agents which can be used to produce a ligand suitable for use in the assay.

Nonspecific binding may be determined by carrying out the binding reaction in the presence of a large excess of unlabeled ligand. For example, labeled ligand may be incubated with receptor and test compound in the presence of a thousandfold excess of unlabeled ligand. Nonspecific binding should be subtracted from total binding, i.e. binding in the absence of unlabeled ligand, to arrive at the specific binding for each sample tested. Other steps such as washing, stirring, shaking, filtering and the like may be included in the assays as necessary. Typically, wash steps are included after the separation of membrane-bound ligand from ligand remaining in solution and prior to quantitation of the amount of ligand bound, e.g., by counting radioactive isotope. The specific binding obtained in the presence of test compound is compared with that obtained in the presence of labeled ligand alone to determine the extent to which the test compound has displaced receptor binding.

In performing binding assays, care must be taken to avoid artifacts which may make it appear that a test compound is interacting with the DRR receptor when, in fact, binding is being inhibited by some other mechanism. For example, the compound being tested should be in a buffer which does not itself substantially inhibit the binding of ligand to DRR and should, preferably, be tested at several different concentrations. Preparations of test compound should also be examined for proteolytic activity and it is desirable that antiproteases be included in assays. Finally, it is highly desirable that compounds identified as displacing the binding of ligand to DRR receptor be reexamined in a concentration range sufficient to perform a Scatchard analysis on the results. This type of analysis is well known in the art and can be used for determining the affinity of a test compounds for receptor (see e.g., Ausubel, et al., *Current Protocols in Molecular Biology*, 11.2.1-11.2.19 (1993); *Laboratory Techniques and Biochemistry and Molecular Biology*, Work, et al., ed., N.Y. (1978) etc.). Computer programs may be used to help in the analysis of results (see e.g., Munson, P., *Methods Enzymol.* 92:543-577 (1983); McPherson, G.A., *Kinetic, EBDA*

*Ligand. Lowry-A Collection of Radioligand Binding Analysis Programs. Elsevier-Biosoft, U.K. (1985)).*

15 The activation of receptor by the binding of ligand may be monitored using a number of different assays. For example, adenyl cyclase assays may be performed by growing cells in wells of a microtiter plate and then incubating the various wells in the presence or absence of test compound. cAMP may then be extracted in ethanol, lyophilized and resuspended in assay buffer. Assay of cAMP thus recovered may be carried out using any method for determining cAMP concentration, e.g. the Biotrack cAMP Enzyme-immunoassay System (Amersham) or the Cyclic AMP [3H] Assay System (Amersham). Typically, adenyl cyclase assays will be performed separately from binding assays, but it may also be possible to perform binding and adenyl cyclase assays on a single preparation of cells. Other "cell signaling assays" that can be used to monitor receptor activity are described below.

15

#### **IV. Identification of DRR Agonists and Antagonists Using Cell Signaling Assays**

DRRs may also be used to screen for drug candidates using cell signaling assays. To identify DRR agonists, the DNA encoding a receptor is incorporated into an expression vector and then transfected into an appropriate host. The transformed cells are then contacted with a series of test compounds and the effect of each is monitored. Among the assays that can be used are assays measuring cAMP production (see discussion above), assays measuring the activation of reporter gene activity, or assays measuring the modulation of the binding of GTP-gamma-S.

25 Cell signaling assays may also be used to identify DRR antagonists. G protein-coupled receptors can be put in their active state even in the absence of their cognate ligand by expressing them at very high concentration in a heterologous system. For example, receptor may be overexpressed using the baculovirus infection of insect Sf9 cells or a DRR gene may be operably linked to a CMV promoter and expressed in COS or HEK293 cells. In this 30 activated constitutive state, antagonists of the receptor can be identified in the absence of

ligand by measuring the ability of a test compound to inhibit constitutive cell signaling activity. Appropriate assays for this are, again, cAMP assays, reporter gene activation assays or assays measuring the binding of GTP-gamma-S.

- 5    One preferred cell signaling assay is based upon the observation that cells stably transfected with DRRs show a change in intracellular calcium levels in response to incubation in the presence of angiotensin II or III (see Example 5). Thus, a procedure can be used to identify DRR agonists or antagonists that is similar to the radioreceptor assays discussed above except that angiotensin II or III is used instead of a labeled ligand and
- 10   calcium concentration is measured instead of bound radioactivity. The concentration of calcium in the presence of test compound and angiotensin II or III is compared with that in the presence of angiotensin II or III alone to determine whether the test compound is interacting at the DRR receptor. A statistically significant increase in intracellular calcium in response to test compound indicates that the test compound is acting as an agonist
- 15   whereas a statistically significant decrease in intracellular calcium indicates that it is acting as an antagonist.

#### **V. Assay for Ability to Modulate DRR Expression**

One way to either increase or decrease the biological effects of a DRR is to alter the extent to which the receptor is expressed in cells. Therefore, assays for the identification of compounds that either inhibit or enhance expression are of considerable interest. These assays are carried out by growing cells expressing a DRR in the presence of a test compound and then comparing receptor expression in these cells with expression in cells grown under essentially identical conditions but in the absence of the test compound. As in the binding assays discussed above, it is desirable that the cells used be substantially free of competing G protein-coupled receptors. One way to quantitate receptor expression is to fuse the DRR sequence to a sequence encoding a peptide or protein that can be readily quantitated. For example, the DRR sequence may be ligated to a sequence encoding haemagglutinin as described in Example 5 and used to stably transfect cells. After

incubation with test compound the hemagglutinin/receptor complex can be immunoprecipitated and western blotted with anti- haemagglutinin antibody. Alternatively, Scatchard analysis of binding assays may be performed with labeled ligand to determine receptor number. The binding assays may be carried out as discussed above 5 and will preferably utilize cells that have been engineered to recombinantly express DRR.

A preferred group of test compounds for inclusion in the DRR expression assay consists of oligonucleotides complementary to various segments of the DRR nucleic acid sequence. These oligonucleotides should be at least 15 bases in length and should be derived from 10 non-conserved regions of the receptor nucleic acid sequence. Sequences may be based upon those shown as SEQ ID numbers 2, 4, 6, 8, 10, 12 or 14.

Oligonucleotides which are found to reduce receptor expression may be derivatized or conjugated in order to increase their effectiveness. For example, nucleoside 15 phosphorothioates may be substituted for their natural counterparts (see Cohen, J., Oligodeoxynucleotides, Antisense Inhibitors of Gene Expression, CRC Press (1989)). The oligonucleotides may be delivered to a patient in vivo for the purpose of inhibiting DRR expression. When this is done, it is preferred that the oligonucleotide be administered in a form that enhances its uptake by cells. For example, the oligonucleotide may be delivered 20 by means of a liposome or conjugated to a peptide that is ingested by cells (see e.g., U.S. Patent Nos. 4,897,355 and 4,394,448; see also non-U.S. patent documents WO 8903849 and EP 0263740). Other methods for enhancing the efficiency of oligonucleotide delivery are well known in the art and are also compatible with the present invention.

25 Having now described the invention, the same will be more readily understood through reference to the following Examples which are provided by way of illustration and which are not intended to limit the scope of the invention.

**EXAMPLES****Example 1: Cloning of Rat DRR-1**

Isolation of cDNA fragment.

5

Degenerate oligonucleotides were synthesized to highly conserved regions of G-protein coupled receptors (transmembrane spanning domains 2 and 7) with the following nucleotide sequences:

10 5' GG CCG TCG ACT TCA TCG TC(A/T) (A/C)(T/C)C TI(G/T) CI(T/C) TIG  
C(A/C/G/T)G 3' (TM2:sense) SEQ ID NO:15; and

5' (A/G)(C/A/T)(A/T) (A/G)CA (A/G)TA IAT IAT IGG (A/G)TT 3'  
(TM7:antisense) SEQ ID NO:16.

15

Poly A+ mRNA was isolated from cultured fetal rat dorsal root ganglia (Sprague-Dawley). The mRNA was reverse transcribed using the First Strand cDNA Synthesis kit (Pharmacia Biotech), subjected to an amplification reaction by polymerase chain reaction (PCR) using Ampli-Taq DNA (Perkin-Elmer Cetus) polymerase under the following conditions: 3 minutes at 94 °C, 40 cycles of 1 minute at 94 °C, 45°C and 72 °C. A cDNA PCR fragment corresponding to approximately 650 bps was isolated and subcloned in pGEM-T-vector (Promega Corporation). The nucleotide sequence of the recombinant clone was determined using the T7-dideoxy chain termination sequencing kit (Pharmacia Biotech) and was found to be unique based upon searches of Genbank/EMBL databases.

The full length rat DRR-1 sequence was obtained from rat genomic DNA using the 650 base pair fragment and the "Promoter Finder DNA Walking kit" (Clontech, cat # K1806-1). This kit contains five libraries of uncloned, adaptor-ligated genomic DNA fragments. The procedure involves two consecutive PCR reactions. Both reactions were done using the

"Advantage Tth Polymerase Mix" also obtained from Clontech, following the conditions recommended by the vendor. The first PCR reaction was performed with the outer adaptor primer (AP1) provided in the kit and an outer, gene-specific primer (GSP1) derived from the sequence of the DRR-1 PCR fragment. The primary PCR mixtures were diluted and used as a template for the secondary (nested) PCR reaction with the nested adapter primer (AP2) and a nested gene specific primer (GSP2). To obtain the sequence of the rat DRR-1 gene upstream of the sequence of the original PCR fragment, the following oligonucleotides were used:

10 GSP1: oligo YF3B59-B, 5'-CGCAGATGAGGTAGTACAGCATCAC SEQ ID NO:17  
GSP2: oligo MML-R1, 5'- CTGTGAGAGAGATGGTAACATACAG SEQ ID NO:18

15 From the first library, a fragment AP2-MMLR1 of 1.9 Kb was obtained and from the third library, a fragment of approximately 1.0 Kb was obtained. To identify the sequence downstream of the known sequence, the following primers were used:

GSP1: oligo YF3B59-F2, 5'-GCATCCTGACTGGTTCTTCTCAG SEQ ID NO:19  
GSP2: oligo MML-F1, 5'- GGGTGAGACTCATCATCATTGTGG. SEQ ID NO:20

20 A fragment MMLF1-AP2 of approximately 1 Kb was obtained from the first library and a fragment of about 600 bp was obtained from the third library. The composite sequence of 1154 nucleotides containing the complete predicted open reading frame of DRR-1 is shown in Figure 1. The open reading frame codes for a 337 amino acid protein (Figure 2) with a predicted molecular mass of 38.7 kD. The protein sequence contains all the characteristic 25 features of G protein-coupled receptors: seven hydrophobic helices likely to represent transmembrane domains, potential glycosylation site at the N-terminal extracellular domain (position 30) and a conserved NPXXY sequence at position 285-289.

Example 2: Cloning of Human DRR Receptor Genes

Two approaches were used to identify and clone novel human DNA sequences homologous and/or related to the rat DRR-1 gene. First, a human genomic library was 5 screened in the lambda vector, Fix II, (Stratagene Cat.# 946203). Approximately 106 human genomic clones were plated and transferred onto nitrocellulose membranes for hybridization with the full length, 32P labeled, rat DRR-1 sequence as a probe. The hybridization was performed at 42 °C, overnight. The filters were washed at room temperature at low stringency (1X SSC/ 0.1% SDS) to allow detection of related but not 10 necessarily identical sequences.

The inserted human DNA present in positive phages was amplified by PCR using the "Expand PCR kit" from Boehringer-Mannheim under conditions allowing accurate 15 amplification of very large fragments of DNA. These long fragments of DNA were digested with various restriction enzymes and subcloned into a plasmid vector. The portions of these clones which hybridized with the rat DRR-1 gene probe were sequenced using the ABI cycle sequencing kit.

A second approach to identifying novel human sequences related to DRR-1 involved the 20 use of the polymerase chain reaction (PCR), performed on total human genomic DNA. Primers were synthesized based upon the human genomic clones described above and were as follows:

HML.H, 5'-GCAAGCTTCTGAGCATGGATCCAACCGTC, SEQ ID 21 and  
25 HML.Bg, 5'-CCCTCAGATCTCCAATTGCTTCCCGACAG, SEQ ID NO:22.

Amplification resulted in fragments of approximately 1 kilobase containing the entire coding sequence of the human genes. These fragments obtained were subcloned into the pGEM-T (Promega) vector for DNA sequencing analysis.

Using the above strategies, six human clones were isolated:  
clone 7, SEQ ID numbers 3 and 4;  
clone 18, SEQ ID numbers 5 and 6;  
clone 23, SEQ ID numbers 7 and 8;  
5 clone 24, SEQ ID numbers 9 and 10;  
clone 36, SEQ ID numbers 11 and 12; and  
clone 40, SEQ ID numbers 13 and 14.

None of these clones contain introns and their alignment may be seen in Figure 3.

10

At the amino acid sequence level, the rat DRR-1 clone is 47% to 49% identical to the human clones.

15 At the nucleic acid level, the rat DRR-1 clone is 56% to 58% identical to the human clones. The level of sequence identity within the human clones (7, 18, 23, 24, 36, 40) is very high, between 77% and 98% at the amino acid sequence level. All the human sequences were used as queries to search for homologies in public databases (Genbank, Swissprot, EST). No identical sequences were detected. The closest matches were to members of the mas oncogene family of proteins. The overall amino acid sequence  
20 homology between rat DRR-1 and any of the isolated human genes varied from 47 to 50 %. However some stretches display a much higher level of sequence homology, particularly the regions encoding the putative transmembrane domain III and VII (TM3 and TM7) and the intracellular loops 2 and 3 where the homology between the rat sequence and its human homologue is around 80%.

25

#### Example 3: In Situ Hybridization Experiments

Preparation of Tissue: Adult male Sprague-Dawley rats (~300 gm; Charles River, St-Constant, Quebec) were sacrificed by decapitation. Brain and spinal cord with dorsal root ganglia attached were removed, snap-frozen in isopentane at -40°C for 20 s and stored at -80 °C. Frozen human brain, spinal cord and dorsal root ganglia were obtained from the

Brain and Tissue Bank for Developmental Disorders, University of Maryland at Baltimore, according to the strictest ethical guidelines. Frozen tissue was sectioned at 14  $\mu$ m in a Microm HM 500 M cryostat (Germany) and thaw-mounted onto ProbeOn Plus slides (Fisher Scientific, Montreal, Quebec). Sections were stored at -80°C prior to in situ hybridization.

**Synthesis of Riboprobes:** The plasmid pGemT-3b32 GPCR was linearized using either SacII and Not I restriction enzymes. Sense and antisense DRR riboprobes were transcribed in vitro using either T7 or SP6 RNA polymerases (Pharmacia Biotech), respectively in the presence of [<sup>35</sup>S]UTP (~800 Ci/mmol; Amersham, Oakville, Ontario). The plasmid pGemT-Clone 36 GPCR was linearized using SacII and Pst I restriction enzymes. Sense and antisense Clon36 riboprobes were transcribed in vitro using either SP6 or T7 RNA polymerases (Pharmacia Biotech), respectively in the presence of [<sup>35</sup>S]UTP. Following transcription, the DNA template was digested with DNase I (Pharmacia). Riboprobes were purified by phenol/chloroform/isoamyl alcohol extraction and precipitated in 70% ethanol containing ammonium acetate and tRNA. Quality of labeled riboprobes was verified by polyacrylamide-urea gel electrophoresis.

**In situ Hybridization:** Sections were postfixed in 4% paraformaldehyde (BDH, Poole, England) in 0.1 M phosphate buffer (pH 7.4) for 10 min at room temperature (RT) and rinsed in three changes of 2X standard sodium citrate buffer (SSC; 0.15 M NaCl, 0.015 M sodium citrate, pH 7.0). Sections were then equilibrated in 0.1 M triethanolamine, treated with 0.25% acetic anhydride in triethanolamine, rinsed in 2X SSC and dehydrated in an ethanol series (50-100%). Hybridization was performed in a buffer containing 75% formamide (Sigma, St-Louis, Mo), 600 mM NaCl, 10 mM Tris (pH 7.5), 1 mM EDTA, 1X Denhardt's solution (Sigma), 50 (g/ml denatured salmon sperm DNA (Sigma), 50 (g/ml yeast tRNA (Sigma), 10% dextran sulfate (Sigma), 20 mM dithiothreitol and [<sup>35</sup>S]UTP-labeled cRNA probes (10 X 10<sup>6</sup> cpm/ml) at 55°C for 18 h in humidified chambers. Following hybridization, slides were rinsed in 2X SSC at RT, treated with 20 (g/ml RNase IA (Pharmacia) in RNase buffer (10 mM Tris, 500 mM NaCl, 1 mM EDTA, pH 7.5) for 45

min at RT and washed to a final stringency of 0.1X SSC at 65 °C. Sections were then dehydrated and exposed to Kodak Biomax MR film for 21 days and/or dipped in Kodak NTB2 emulsion diluted 1:1 with distilled water and exposed for 4-6 weeks at 4°C prior to development and counterstaining with cresyl violet acetate (Sigma).

5

**Results:** Of all regions examined within the neuraxis of the rat, DRR-1 mRNA was exclusively expressed in dorsal root ganglia. High resolution emulsion autoradiography showed accumulations of silver grains exclusively over small and some medium size neurons. This unique and highly restricted distribution pattern for DRR-1 was confirmed in 10 the rat embryo. Sagittal section of an E17 rat fetus showed that DRR-1 mRNA is confined to DRGs. All other structures of the rat embryo were devoid of any specific hybridization signal reinforcing the highly selective nature of DRR-1 expression

15 The expression of human Clone 36 receptor was present in human fetal dorsal root ganglia but not in spinal cord. Specific hybridization signal for Clone 36 was not detected in any of the human adult CNS tissues examined thus far. These include spinal cord, cortex, hippocampus, thalamus, substantia nigra and periaqueductal gray (data not shown). Presence of Clone 36 mRNA in adult DRGs remains to be examined. Standard controls in 20 which additional spinal cord with DRG sections were hybridized with rat DRR-1 antisense or Clone 36 sense 35S-labeled probes displayed no specific hybridization signal.

#### Example 4: Northern Blots

Commercial rat and human multiple Northern blots containing 2 g of polyA RNA from 25 various tissues (Clontech) were used to determine the expression and distribution of the rat DRR-1 message and its human homologues. Radioactively labeled probes were prepared as follows: twenty five ng of a 650 bp 3b-32 PCR fragment derived from rat DRR-1 (see Example 1) or human clone 36 were random-prime labeled using the Ready-to-Go DNA labeling kit (Pharmacia Biotech) and [32P]CTP (3000 Ci/mmol/Amersham). The blot was prehybridized for 1 hour at 68 °C using Expresshyb (Clontech) followed by hybridization 30 (2X10<sup>6</sup> cpm/ml of probe) for one hour using the same conditions. Blots were washed at

room temperature in 2X SSC, 0.05% SDS for 30 min. followed by 3x washes in 0.2X SSC, 1 % SDS at 50 °C for 60 min. and exposed at -80 °C to Kodak Biomax film for 6 days.

5   **Expression and Distribution of rat DRR-1:** All the rat tissues studied (heart, brain, spleen, lung, skeletal muscle, kidney and testis) were negative for the expression of DRR-1 following 2 weeks exposure whereas rat genomic Southern analysis revealed a 1.1 kb band when probed with the same cDNA fragment.

10   **Expression and Distribution of Human Clone 36:** Northern blots containing RNA from various human tissues were probed with a radio-labeled DNA fragment from clone 36. All the human tissues studied (human fetal brain, lung, liver and kidney and adult human cerebellum, cerebral cortex, medulla, occipital pole, frontal lobe, temporal lobe, putamen, spinal cord, amygdala, caudate nucleus, corpus callosum, hippocampus, total brain, 15 subthalamic nucleus and thalamus) were negative for the expression of this receptor following 2 weeks exposure.

Example 5: Calcium Signaling in Response to Angiotensin I-III

20   The coding sequence of human clone 24 was transferred into a pcDNA3 vector and modified to add a haemagglutinin tag at the C-terminus of the receptor sequence. This clone, designated as pcDNA3-HML-HA24 was transfected into HEK293 cells using a modified CaCl<sub>2</sub> method (Maniatis, Molecular Cloning: A Laboratory Manual, Cold Spring Harbor Laboratory Press (1989)). The cells were maintained in culture medium at 37 °C, 5% CO<sub>2</sub> and diluted 10 fold every 3 days.

25   The cells were inoculated in 90 mm tissue culture dishes (5 x 10<sup>5</sup> cells per flask) in Dulbecco's Modified Essential Medium (DMEM, Gibco BRL), supplemented with 10% fetal bovine serum (FBS), 100 U/ml penicillin, 100 µg/ml streptomycin and 0.25 µg/ml fungizone. One day after inoculation, cells were transiently transfected with 30 µg of 30 plasmid DNA per dish. The cells were harvested 48 hours post transfection for analysis.

The expression of the gene was first checked by immunoprecipitation and western blotting with an anti-haemagglutinin antibody. A protein of approximately 43 KD was detected in stably as well as transiently transfected HEK293 cells, but not in control cells.

5    Stably transfected HEK293 cells were obtained after approximately 21 days of selection in culture medium containing 800 µg/ml G418. Calcium signaling measurement was performed with one of these stably transfected cell line, 293/pcDNA3-HML-HA24. The cells were grown on a 24 mm round glass cover slides to 50-70% confluence. After rinsing the cells with 1.8 NBS buffer (135 mM NaCl, 5 mM KC1, 1.2 mM MgCl<sub>2</sub>, 1.8 mM 10    CaCl<sub>2</sub>, 5 mM glucose and 10 mM HEPES, pH 7.3), the cells were incubated for one hour at room temperature in the presence of 0.5 ml of 3.5 µM FURA-2 AM (Molecular Probe, F-1221) diluted in 1.8 NBS. The cells were then rinsed three times with 1.8 NBS and incubated for a further 30 minutes at room temperature. The calcium displacement was measured using a PTI (Photon Technology International) D104 photometer equipped with a 15    PTI Delta RAM High speed multiwavelength illuminator, a PTI SC500 Shutter controller, a PTI LPS220 ARC lamp supply and the PTI FELIX software, v.1.2. Groups of 2 to 8 cells were chosen and isolated with the photometer diaphragm. The cells were exposed to 340 and 380 nm light and the 510 nm light emitted by the cells was recorded. Angiotensin I, II and III, were added successively - in various order from one experiment to the next - 20    followed by bradykinin as a positive control. Upon stimulation with angiotensin II and angiotensin III, a significant response was obtained. Addition of angiotensin I produced no response.

**INDICATIONS RELATING TO DEPOSITED MICROORGANISM  
OR OTHER BIOLOGICAL MATERIAL**

(PCT Rule 13bis)

A. The indications made below relate to the deposited microorganism or other biological material referred to in the description on page 6 . line 8-9

**B. IDENTIFICATION OF DEPOSIT**

Further deposits are identified on an additional sheet

Name of depositary institution

Deutsche Sammlung von Mikroorganismen und Zellkulturen GmbH (DSMZ)

Address of depositary institution (including postal code and country)

Mascheroder Weg 1b  
D-38124 Braunschweig  
Germany

Date of deposit

27 November 1997

Accession Number

DSM 11877

**C. ADDITIONAL INDICATIONS** (leave blank if not applicable)

This information is continued on an additional sheet

In respect of all designated states in which such action is possible and to the extent that it is legally permissible under the law of the designated state, it is requested that a sample of the deposited micro-organism be made available only by the issue thereof to an independent expert, in accordance with the relevant patent legislation, e.g. Rule 28(4) EPC, and generally similar provisions *mutatis mutandis* for any other designated state.

**D. DESIGNATED STATES FOR WHICH INDICATIONS ARE MADE** (if the indications are not for all designated States)

**E. SEPARATE FURNISHING OF INDICATIONS** (leave blank if not applicable)

The indications listed below will be submitted to the International Bureau later (specify the general nature of the indications e.g. "Accession Number of Deposit")

CLAIMS

1. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of rat dorsal root receptor 1 (DRR-1) as shown in SEQ ID NO:1.  
5
2. A substantially pure protein according to claim 1, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:1.
3. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of rat DRR-1 as shown in SEQ ID NO:1.  
10
4. The polynucleotide of claim 3, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:1.
- 15 5. The polynucleotide of claim 4, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:2.
6. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 1 (DRR-1) as shown in SEQ ID NO:3.  
20
7. A substantially pure protein according to claim 6, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:3.
- 25 8. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-1 as shown in SEQ ID NO:3.
9. The polynucleotide of claim 8, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:3.

10. The polynucleotide of claim 9, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:4.
11. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 2 (DRR-2) as shown in SEQ ID NO:5.
12. A substantially pure protein according to claim 11, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:5.
- 10 13. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-2 as shown in SEQ ID NO:5.
14. The polynucleotide of claim 13, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:5.
- 15 15. The polynucleotide of claim 14, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:6.
16. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 3 (DRR-3) as shown in SEQ ID NO:7.
- 20 17. A substantially pure protein according to claim 16, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:7.
- 25 18. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-3 as shown in SEQ ID NO:7.
19. The polynucleotide of claim 18, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:7.

20. The polynucleotide of claim 19, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:8.
21. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 4 (DRR-4) as shown in SEQ ID NO:9.
22. A substantially pure protein according to claim 21, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:9.
- 10 23. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-4 as shown in SEQ ID NO:9.
24. The polynucleotide of claim 23, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:9.
- 15 25. The polynucleotide of claim 24, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:10.
26. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 5 (DRR-5) as shown in SEQ ID NO:11.
- 20 27. A substantially pure protein according to claim 26, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:11.
28. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-5 as shown in SEQ ID NO:11.
- 25 29. The polynucleotide of claim 28, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:11.

30. The polynucleotide of claim 29, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:12.
31. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 6 (DRR-6) as shown in SEQ ID NO:13.
32. A substantially pure protein according to claim 31, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:13.
- 10 33. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-6 as shown in SEQ ID NO:13.
34. The polynucleotide of claim 33, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:13.
- 15 35. The polynucleotide of claim 34, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:14.
36. An antibody made by a process comprising the step of injecting a pharmaceutically acceptable preparation comprising the protein of anyone of claims 1, 2, 6, 7, 11, 12, 20 16, 17, 21, 22, 26, 27, 31 or 32, into an animal capable of producing said antibody.
37. An antibody that binds specifically to anyone of the proteins of claims 1, 2, 6, 7, 11, 12, 16, 17, 21, 22, 26, 27, 31 or 32
- 25 38. A vector for expressing rat DRR-1, comprising the polynucleotide of either one of claim 3 or 4.

39. A vector for expressing anyone of

- (i) human DRR-1, comprising a polynucleotide of claim 8 or 9;
- (ii) human DRR-2, comprising a polynucleotide of claim 13 or 14;
- 5 (iii) human DRR-3, comprising a polynucleotide of claim 18 or 19;
- (iv) human DRR-4, comprising a polynucleotide of claim 23 or 24;
- (v) human DRR-5, comprising a polynucleotide of claim 28 or 29;
- (vi) human DRR-6, comprising a polynucleotide of claim 33 or 34.

10 40. A host cell transformed with a vector according to claim 38 or 39.

41. Recombinant rat DRR-1, human DRR-1, human DRR-2, human DRR-3, human DRR-4, human DRR-5, human DRR-6, produced by the host cell of claim 40.

15 42. A method for assaying a test compound for its ability to bind or to activate a G protein-coupled dorsal root ganglia specific receptor (DRR), comprising:

- a) incubating a source containing DRR but substantially free of other G protein-coupled receptors, with
- 20 i) a ligand known to bind to DRR;
- ii) said test compound; and

b) determining the extent to which said ligand binding is displaced by said test compound.

## NOVEL G PROTEIN-COUPLED RECEPTOR

Field of the Invention

The present invention is in the general field of biological receptors and the various uses  
5 that can be made of such receptors. More specifically, the invention relates to nucleic acids  
encoding novel G protein-coupled receptors and to the receptors per se.

Background and Prior Art

G protein-coupled receptors (GPCRs) constitute a family of proteins sharing a common  
10 structural organization characterized by an extracellular N-terminal end, seven hydrophobic  
alpha helices putatively constituting transmembrane domains and an intracellular C-  
terminal domain. GPCRs bind a wide variety of ligands that trigger intracellular signals  
through the activation of transducing G proteins (*Caron, et al., Rec. Prog. Horm. Res.*  
48:277-290 (1993); *Freedman et al., Rec. Prog. Horm. Res.* 51:319-353 (1996)).

15

More than 300 GPCRs have been cloned thus far and it is generally assumed that there  
exist well over 1000 such receptors. Mechanistically, approximately 50-60% of all  
clinically relevant drugs act by modulating the functions of various GPCRs (*Cudermann, et  
al., J. Mol. Med.* 73:51-63 (1995)). Of particular interest are receptors located in dorsal root  
20 ganglia. This region of the central nervous system is densely innervated with primary or  
afferent sensory neurons involved in the transmission, modulation and sensation of pain.  
Thus, receptors from this region may be used in assays for the identification of new agents  
for anesthesia and analgesia

25 Summary of the Invention

The present invention is based upon the discovery of a novel G protein-coupled receptor  
which is distinct from previously reported receptors in terms of structure and in being  
expressed preferentially in dorsal root ganglia. One dorsal root receptor (DRR) has been  
isolated and sequenced from the rat and six from the human. The rat receptor was given the

designation rDRR-1 and its amino acid sequence is shown as SEQ ID NO:1. The human receptors were designated as

- hDRR-1 (SEQ ID NO:3);
- hDRR-2 (SEQ ID NO:5);
- 5 hDRR-3 (SEQ ID NO:7);
- hDRR-4 (SEQ ID NO:9);
- hDRR-5 (SEQ ID NO:11); and
- hDRR-6 (SEQ ID NO:13).

Unless otherwise specified, the term "DRR" as used herein refers to all of the receptors  
10 from both human and rat.

In its first aspect, the invention is directed to proteins, except as existing in nature, comprising the amino acid sequence consisting functionally of a rat or human DRR as shown in SEQ ID NO:1, 3, 5, 7, 9, 11, or 13. The term "consisting functionally of" is  
15 intended to include any receptor protein whose sequence has undergone additions, deletions or substitutions which do not substantially alter the functional characteristics of the receptor. Thus, the invention encompasses proteins having exactly the same amino acid sequence as shown in the sequence listing, as well as proteins with differences that are not substantial as evidenced by their retaining the basic, qualitative binding properties of  
20 the DRR receptor. The invention further encompasses substantially pure proteins consisting essentially of a DRR amino acid sequence, antibodies that bind specifically to a DRR (i.e. that have at least a 100 fold greater affinity for the DRR than any other naturally occurring non-DRR protein), and antibodies made by a process involving the injection of  
25 pharmaceutically acceptable preparations of such proteins into an animal capable of antibody production. In a preferred embodiment, monoclonal antibody to human or rat DRR is produced by injecting a pharmaceutically acceptable preparation of the receptor into a mouse and then fusing mouse spleen cells with myeloma cells.

30 The invention is also directed to a substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of the sequence of rat DRR (as

shown in SEQ ID NO:1) or a human DRR (as shown in SEQ ID NOs 3, 5, 7, 9, 11 or 13). This aspect of the invention encompasses polynucleotides encoding proteins consisting essentially of the amino acid sequences shown in the sequence listing, expression vectors comprising such polynucleotides, and host cells transformed with such vectors. Also 5 included are the recombinant rat and human DRR proteins produced by host cells made in this manner.

Preferably, the polynucleotide encoding rat DRR has the nucleotide sequence shown in SEQ ID NO:2 and the polynucleotide encoding a human DRR has the nucleotide sequence 10 shown in SEQ ID NO: 3, 5, 7, 9, 11 or 13. It is also preferred that the vectors and host cells used for the expression of DRR contain these particular polynucleotides.

In another aspect, the present invention is directed to a method for assaying a test compound for its ability to bind to a rat or human DRR. The method is performed by 15 incubating a source of DRR with a ligand known to bind to the receptor and with the test compound. The source of the DRR should be substantially free of other types of G protein-coupled receptors, i.e. greater than 85% of such receptors present should correspond to the DRR. Upon completion of incubation, the ability of the test compound to bind to the DRR is determined by the extent to which ligand binding has been displaced. The rat DRR should, preferably correspond to rDRR-1 as shown in SEQ ID NO:1. The human receptor 20 should preferably be hDRR-1 (SEQ ID NO:3); hDRR-2 (SEQ ID NO:5); hDRR-3 (SEQ ID NO:7); hDRR-4 (SEQ ID NO:9); hDRR-5 (SEQ ID NO:11); or hDRR-6 (SEQ ID NO:13). Either transformed cells expressing recombinant DRR may be used in the assays or 25 membranes can be prepared from the cells and used. Although not essential, the assay can be accompanied by the determination of the activation of a second messenger pathway such as the adenyl cyclase pathway. This should help to determine whether a compound that binds to DRR is acting as an agonist or antagonist.

An alternative method for determining if a test compound is an agonist of any of the 30 DRRs disclosed herein is to use a cell signaling assay, e.g., an assay measuring either

intracellular adenyl cyclase activity or intracellular calcium concentration. The test compound is incubated with cells expressing the DRR but substantially free of other G protein-coupled receptors, typically a cell transfected with an expression vector encoding the DRR. Test compounds that are agonists are identified by their causing a statistically significant change in the results obtained from the cell signaling assay when compared to control transfectants not exposed to test compound. For example, the cells exposed to the test compound may show a significant increase in adenyl cyclase activity or in intracellular calcium concentration.

10 The invention also encompasses a method for determining if a test compound is an antagonist of a DRR which relies upon the known activation of G protein-coupled receptors that occurs when such receptors are expressed in large amounts. This method requires that DNA encoding the receptor be incorporated into an expression vector so that it is operably linked to a promoter and that the vector then be used to transfect an appropriate host. In order to produce sufficient receptor to result in constitutive receptor activation (i.e., activation in the absence of natural ligand), expression systems capable of copious protein production are preferred, e.g., the DRR DNA may be operably linked to a CMV promoter and expressed in COS or HEK293 cells. After transfection, cells with activated receptors are selected based upon their showing increased activity in a cell 15 signaling assay relative to comparable cells that have either not been transfected or that have been transfected with a vector that is incapable of expressing functional DRR. Typically, cells will be selected either because they show a statistically significant increase in intracellular adenyl cyclase activity or a statistically significant increase in intracellular calcium concentration. The selected cells are contacted with the test 20 compound and the cell signaling assay is repeated to determine if this results in a decrease in activity relative to control cells not contacted with the test compound. For example, a statistically significant decrease in either adenyl cyclase activity or calcium concentration relative to control cells would indicate that the test compound is an antagonist of the DRR. Any of the DRRs disclosed herein may be used in these assays.

Assays for compounds interacting with a DRR may be performed by incubating a source containing the DRR but substantially free of other G protein-coupled receptors (e.g. a stably transformed cell) with angiotensin II or III in both the presence and absence of test compound and measuring the modulation of intracellular calcium concentration. A

5 significant increase or decrease in angiotensin-stimulated calcium displacement in response to test compound is indicative of an interaction occurring at the DRR. The receptors that may be used in these assays include rat DRR-1 and human DRR-1, DRR-2, DRR-3, DRR-4, DRR-5 and DRR-6.

10 In another aspect, the present invention is directed to a method for assaying a test compound for its ability to alter the expression of a rat or human DRR. This method is performed by growing cells expressing the DRR, but substantially free of other G protein-coupled receptors, in the presence of the test compound. Cells are then collected and the expression of the DRR is compared with expression in control cells grown under

15 essentially identical conditions but in the absence of the test compound. The rat receptor is preferably rDRR-1 and the human receptor may be DRR-1; DRR-2; DRR-3; DRR-4; DRR-5; or DRR-6.

20 A preferred test compound is an oligonucleotide at least 15 nucleotides in length comprising a sequence complimentary to the sequence of the DRR used in the assay.

Brief Description of the Drawings

Figure 1. Nucleotide sequence of rDRR-1: Clone 3B-32, encoding rDRR-1, was isolated from a rat genomic library using the Promoter Finder Walking Kit (see Methods, Clontech).

5

The cloned gene was deposited with the international depositary authority Deutsche Sammlung Von Mikroorganismen Und Zellkulturen GmbH at the address Mascheroder Weg 1 B, D-3300 Braunschweig, Germany. The deposit was made on November 27, 1997 and was given the accession number DSM 11877.

10

Figure 2. Deduced amino acid sequence of DRR-1: Clone 3B-32 codes for a 337 amino acid protein. The amino acid sequence begins with the first ATG in the nucleotide sequence.

15

Figure 3. Alignment of the deduced amino acid sequences of clone 3B-32 (rDRR-1) with its five most homologous sequences. The boxed and shaded residues are the ones that are identical to the rDRR-1 sequence.

20

Figure 4. Amino acid alignment of the human DRR homologs: The amino acid sequence of all 6 human homologs of rDRR-1 (hDRR-1; hDRR-2; hDRR-3; hDRR-4; hDRR-5; and hDRR-6) are aligned. The amino acid residues differing from the clone 36 (HUMAN36.PR) are boxed. The degree of identity among these sequences ranges from 77% to almost 100%.

25

Definitions

The description that follows uses a number of terms that refer to recombinant DNA technology. In order to provide a clear and consistent understanding of the specification and claims, including the scope to be given such terms, the following definitions are provided.

30

**Cloning vector:** A plasmid or phage DNA or other DNA sequence which is able to replicate autonomously in a host cell, and which is characterized by one or a small number of restriction endonuclease recognition sites. A foreign DNA fragment may be spliced into the vector at these sites in order to bring about the replication and cloning of the fragment.

5 The vector may contain a marker suitable for use in the identification of transformed cells. For example, markers may provide tetracycline resistance or ampicillin resistance.

**Expression vector:** A vector similar to a cloning vector but which is capable of inducing the expression of the DNA that has been cloned into it, after transformation into a host.

10 The cloned DNA is usually placed under the control of (i.e., operably linked to) certain regulatory sequences such as promoters or enhancers. Promoter sequences may be constitutive, inducible or repressible.

**Substantially pure:** As used herein, "substantially pure" means that the desired product

15 is essentially free from contaminating cellular components. A "substantially pure" protein or nucleic acid will typically comprise at least 85% of a sample, with greater percentages being preferred. Contaminants may include proteins, carbohydrates or lipids. One method for determining the purity of a protein or nucleic acid is by electrophoresing a preparation in a matrix such as polyacrylamide or agarose. Purity is evidenced by the appearance of a 20 single band after staining. Other methods for assessing purity include chromatography and analytical centrifugation.

**Host:** Any prokaryotic or eukaryotic cell that is the recipient of a replicable expression vector or cloning vector is the "host" for that vector. The term encompasses prokaryotic or 25 eukaryotic cells that have been engineered to incorporate a desired gene on its chromosome or in its genome. Examples of cells that can serve as hosts are well known in the art, as are techniques for cellular transformation (see e.g. Sambrook et al., Molecular Cloning: A Laboratory Manual, 2nd ed. Cold Spring Harbor (1989)).

30 **Promoter:** A DNA sequence typically found in the 5' region of a gene, located proximal

to the start codon. Transcription is initiated at the promoter. If the promoter is of the inducible type, then the rate of transcription increases in response to an inducing agent.

**Complementary Nucleotide Sequence:** A complementary nucleotide sequence, as used herein, refers to the sequence that would arise by normal base pairing. For example, the nucleotide sequence 5'-AGAC-3' would have the complementary sequence 5'-GTCT-3'.

**Expression:** Expression is the process by which a polypeptide is produced from DNA. The process involves the transcription of the gene into mRNA and the translation of this mRNA into a polypeptide.

#### Detailed Description of the Invention

The present invention is directed to DRR receptor proteins, genetic sequences coding for the receptors, a method for assaying compounds for binding to DRR receptors and a method for assaying compounds for their ability to alter DRR expression. The receptors and their nucleic acids are defined by their structures (as shown in figures 1, 2 and 4; and SEQ ID numbers 1-14).

It will be understood that the present invention encompasses not only sequences identical to those shown in the figures and sequence listing, but also sequences that are essentially the same and sequences that are otherwise substantially the same and which result in a receptor retaining the basic binding characteristics of the DRR. For example, it is well known that techniques such as site-directed mutagenesis may be used to introduce variations in a protein's structure. Variations in a DRR protein introduced by this or some similar method are encompassed by the invention provided that the resulting receptor retains the basic qualitative binding characteristics of the unaltered DRR. Thus, the invention relates to proteins comprising amino acid sequences consisting functionally of the sequence of SEQ ID NO:1 (rat) and SEQ ID numbers 3, 5, 7, 9, 11 and 14 (human).

### I. Nucleic Acid Sequences Coding for DRR

DNA sequences coding for DRRs are expressed exclusively, or at least highly preferentially, in dorsal root ganglia and these ganglia may serve as a source for the isolation of nucleic acids coding for the receptors. In addition, cells and cell lines that 5 express a rat or human DRR may serve as a source for nucleic acid. These may either be cultured cells that have not undergone transformation or cell lines specifically engineered to express recombinant DRR.

In all cases, poly A+ mRNA is isolated from the dorsal root ganglia, reverse transcribed 10 and cloned. The cDNA library thus formed may then be screened using probes derived from the sequences shown in the accompanying sequence listing as SEQ ID number 2, 4, 6, 8, 10, 12 or 14, depending upon the particular DRR being isolated. Probes should typically be at least 14 bases in length and should be derived from a portion of the DRR sequence 15 that is poorly conserved (see Figures 3 and 4). Screening can also be performed using genomic libraries with one DRR gene, or a portion of the gene, serving as a probe in the isolation of other DRR genes. For example, full length rDRR-1 may be labeled and used to screen a human genomic library for the isolation of hDRR-1, hDRR-2 etc. (see Examples section).

20 Alternatively genomic DNA libraries can be used to isolate DRR genes by performing PCR amplifications with primers located at either end of genes (see Examples section for a description of procedures). For example, human genomic DNA may be amplified using the primers:  
25 5'-GCAAGCTTCTGAGCATGGATCCAACCGTC, and  
5'-CCCTCAGATCTCCAATTGCTTCCGACAG.

This will serve to amplify all six of the human DRR genes identified herein as hDRR-1; hDRR-2; hDRR-3; hDRR-4; hDRR-5; and hDRR-6. These may then be cloned into an appropriate vector, e.g. pGEM-T (Promega), for DNA sequence analysis.

5      **II. Antibodies to Rat and Human DRRs**

The present invention is also directed to antibodies that bind specifically to a rat or human DRR and to a process for producing such antibodies. Antibodies that "bind specifically to a DRR" are defined as those that have at least a one hundred fold greater affinity for the DRR than for any other protein. The process for producing such antibodies may involve 10 either injecting the DRR protein itself into an appropriate animal or, preferably, injecting short peptides made to correspond to different regions of the DRR. The peptides should be at least five amino acids in length and should be selected from regions believed to be unique to the particular DRR protein being targeted. Thus, highly conserved transmembrane regions should generally be avoided in selecting peptides for the generation 15 of antibodies. Methods for making and detecting antibodies are well known to those of skill in the art as evidenced by standard reference works such as: (*Harlow et al., Antibodies. A Laboratory Manual*, Cold Spring Harbor Laboratory, N.Y. (1988)); *Klein, Immunology: The Science of Self-Nonself Discrimination* (1982); *Kennett, et al., Monoclonal Antibodies and Hybridomas: A New Dimension in Biological Analyses* (1980); and *Campbell, "Monoclonal Antibody Technology," in Laboratory Techniques in Biochemistry and Molecular Biology*, (1984)).

"Antibody," as used herein, is meant to include intact molecules as well as fragments which retain their ability to bind to antigen (e.g., Fab and F(ab)2 fragments). These fragments are 25 typically produced by proteolytically cleaving intact antibodies using enzymes such as papain (to produce Fab fragments) or pepsin (to produce F(ab)2 fragments). The term "antibody" also refers to both monoclonal antibodies and polyclonal antibodies. Polyclonal antibodies are derived from the sera of animals immunized with the antigen. Monoclonal antibodies can be prepared using hybridoma technology (*Kohler, et al., Nature* 256:495 30 (1975); *Hammerling, et al., in: Monoclonal Antibodies and T-Cell Hybridomas*. Elsevier,

*M.Y., pp. 563-681 (1981)).* In general, this technology involves immunizing an animal, usually a mouse, with either intact DRR or a fragment derived from the DRR. The splenocytes of the immunized animals are extracted and fused with suitable myeloma cells, e.g., SP2O cells. After fusion, the resulting hybridoma cells are selectively maintained in 5 HAT medium and then cloned by limiting dilution (Wands, et al., *Gastroenterology* 80:225-232 (1981)). The cells obtained through such selection are then assayed to identify clones which secrete antibodies capable of binding to the DRR.

The antibodies, or fragments of antibodies, of the present invention may be used to detect 10 the presence of DRR protein using any of a variety of immunoassays. For example, the antibodies may be used in radioimmunoassays or in immunometric assays, also known as "two-site" or "sandwich" assays (see *Chard, T., "An Introduction to Radioimmune Assay and Related Techniques," in Laboratory Techniques in Biochemistry and Molecular Biology, North Holland Publishing Co., N.Y. (1978)*). In a typical immunometric assay, a 15 quantity of unlabeled antibody is bound to a solid support that is insoluble in the fluid being tested, e.g., blood, lymph, cellular extracts, etc. After the initial binding of antigen to immobilized antibody, a quantity of detectably labeled second antibody (which may or may not be the same as the first) is added to permit detection and/or quantitation of bound antigen (see e.g. *Radioimmune Assay Method*, Kirkham et al., ed., pp. 199-206. E & S. 20 *Livingstone*, Edinburgh (1970)). Many variations of these types of assays are known in the art and may be employed for the detection of the DRR.

Antibodies to a rat or human DRR may also be used in the purification of either the intact receptor or fragments of the receptor (see generally, *Dean et al., Affinity Chromatography, A Practical Approach, IRL Press (1986)*). Typically, antibody is immobilized on a chromatographic matrix such as Sepharose 4B. The matrix is then packed into a column and the preparation containing the DRR desired is passed through under conditions that promote binding, e.g., under conditions of low salt. The column is then washed and bound DRR is eluted using a buffer that promotes dissociation from antibody, e.g., buffer having

an altered pH or salt concentration. The eluted DRR may be transferred into a buffer of choice, e.g., by dialysis, and either stored or used directly.

### III. Radioligand Assay for Receptor Binding

5 One of the main uses for DRR nucleic acids and recombinant proteins is in assays designed to identify agents capable of binding to DRR receptors. Such agents may either be agonists, mimicking the normal effects of receptor binding, or antagonists, inhibiting the normal effects of receptor binding. Of particular interest is the identification of agents which bind to the DRR and modulate adenyl cyclase activity in the cells. These agents have 10 potential therapeutic application as either analgesics or anesthetics.

In radioligand binding assays, a source of DRR is incubated together with a ligand known to bind to the receptor and with the compound being tested for binding activity. The preferred source for DRR is cells, preferably mammalian cells, transformed to recombinantly express the receptor. The cells selected should not express a substantial 15 amount of any other G protein-coupled receptors that might bind to ligand and distort results. This can easily be determined by performing binding assays on cells derived from the same tissue or cell line as those recombinantly expressing DRR but which have not undergone transformation.

20 The assay may be performed either with intact cells or with membranes prepared from the cells (see e.g. Wang, et al., *Proc. Natl. Acad. Sci. U.S.A.* 90:10230-10234 (1993)). The membranes are incubated with a ligand specific for the DRR receptor and with a preparation of the compound being tested. After binding is complete, receptor is separated 25 from the solution containing ligand and test compound, e.g. by filtration, and the amount of binding that has occurred is determined. Preferably, the ligand used is detectably labeled with a radioisotope such as  $^{125}\text{I}$ . However, if desired, fluorescent or chemiluminescent labels can be used instead. Among the most commonly used fluorescent labeling compounds are fluorescein isothiocyanate, rhodamine, phycoerythrin, phycocyanin, allophycocyanin, o-phthaldehyde and fluorescamine. Useful chemiluminescent compounds 30 include luminol, isoluminol, theromatic acridinium ester, imidazole, acridinium salt, and

oxalate ester. Any of these agents which can be used to produce a ligand suitable for use in the assay.

Nonspecific binding may be determined by carrying out the binding reaction in the 5 presence of a large excess of unlabeled ligand. For example, labeled ligand may be incubated with receptor and test compound in the presence of a thousandfold excess of unlabeled ligand. Nonspecific binding should be subtracted from total binding, i.e. binding in the absence of unlabeled ligand, to arrive at the specific binding for each sample tested. Other steps such as washing, stirring, shaking, filtering and the like may be included in the 10 assays as necessary. Typically, wash steps are included after the separation of membrane-bound ligand from ligand remaining in solution and prior to quantitation of the amount of ligand bound, e.g., by counting radioactive isotope. The specific binding obtained in the presence of test compound is compared with that obtained in the presence of labeled ligand alone to determine the extent to which the test compound has displaced receptor binding.

15

In performing binding assays, care must be taken to avoid artifacts which may make it appear that a test compound is interacting with the DRR receptor when, in fact, binding is being inhibited by some other mechanism. For example, the compound being tested should be in a buffer which does not itself substantially inhibit the binding of ligand to DRR and 20 should, preferably, be tested at several different concentrations. Preparations of test compound should also be examined for proteolytic activity and it is desirable that antiproteases be included in assays. Finally, it is highly desirable that compounds identified as displacing the binding of ligand to DRR receptor be reexamined in a concentration range sufficient to perform a Scatchard analysis on the results. This type of analysis is well 25 known in the art and can be used for determining the affinity of a test compounds for receptor (see e.g., Ausubel, et al., *Current Protocols in Molecular Biology*, 11.2.1-11.2.19 (1993); *Laboratory Techniques and Biochemistry and Molecular Biology*, Work, et al., ed., N.Y. (1978) etc.). Computer programs may be used to help in the analysis of results (see e.g., Munson, P., *Methods Enzymol.* 92:543-577 (1983); McPherson, G.A., *Kinetic, EBDA*

*Ligand, Lowry-A Collection of Radioligand Binding Analysis Programs, Elsevier-Biosoft, U.K. (1985)).*

The activation of receptor by the binding of ligand may be monitored using a number of  
5 different assays. For example, adenyl cyclase assays may be performed by growing cells in wells of a microtiter plate and then incubating the various wells in the presence or absence of test compound. cAMP may then be extracted in ethanol, lyophilized and resuspended in assay buffer. Assay of cAMP thus recovered may be carried out using any method for determining cAMP concentration, e.g. the Biotrack cAMP Enzyme-immunoassay System  
10 (Amersham) or the Cyclic AMP [3H] Assay System (Amersham). Typically, adenyl cyclase assays will be performed separately from binding assays, but it may also be possible to perform binding and adenyl cyclase assays on a single preparation of cells. Other "cell signaling assays" that can be used to monitor receptor activity are described below.

15

#### **IV. Identification of DRR Agonists and Antagonists Using Cell Signaling Assays**

DRRs may also be used to screen for drug candidates using cell signaling assays. To identify DRR agonists, the DNA encoding a receptor is incorporated into an expression vector and then transfected into an appropriate host. The transformed cells are then  
20 contacted with a series of test compounds and the effect of each is monitored. Among the assays that can be used are assays measuring cAMP production (see discussion above), assays measuring the activation of reporter gene activity, or assays measuring the modulation of the binding of GTP-gamma-S.

25 Cell signaling assays may also be used to identify DRR antagonists. G protein-coupled receptors can be put in their active state even in the absence of their cognate ligand by expressing them at very high concentration in a heterologous system. For example, receptor may be overexpressed using the baculovirus infection of insect Sf9 cells or a DRR gene may be operably linked to a CMV promoter and expressed in COS or HEK293 cells. In this  
30 activated constitutive state, antagonists of the receptor can be identified in the absence of

ligand by measuring the ability of a test compound to inhibit constitutive cell signaling activity. Appropriate assays for this are, again, cAMP assays, reporter gene activation assays or assays measuring the binding of GTP-gamma-S.

- 5     One preferred cell signaling assay is based upon the observation that cells stably transfected with DRRs show a change in intracellular calcium levels in response to incubation in the presence of angiotensin II or III (see Example 5). Thus, a procedure can be used to identify DRR agonists or antagonists that is similar to the radioreceptor assays discussed above except that angiotensin II or III is used instead of a labeled ligand and
- 10    calcium concentration is measured instead of bound radioactivity. The concentration of calcium in the presence of test compound and angiotensin II or III is compared with that in the presence of angiotensin II or III alone to determine whether the test compound is interacting at the DRR receptor. A statistically significant increase in intracellular calcium in response to test compound indicates that the test compound is acting as an agonist
- 15    whereas a statistically significant decrease in intracellular calcium indicates that it is acting as an antagonist.

#### **V. Assay for Ability to Modulate DRR Expression**

One way to either increase or decrease the biological effects of a DRR is to alter the extent to which the receptor is expressed in cells. Therefore, assays for the identification of compounds that either inhibit or enhance expression are of considerable interest. These assays are carried out by growing cells expressing a DRR in the presence of a test compound and then comparing receptor expression in these cells with expression in cells grown under essentially identical conditions but in the absence of the test compound. As in the binding assays discussed above, it is desirable that the cells used be substantially free of competing G protein-coupled receptors. One way to quantitate receptor expression is to fuse the DRR sequence to a sequence encoding a peptide or protein that can be readily quantitated. For example, the DRR sequence may be ligated to a sequence encoding haemagglutinin as described in Example 5 and used to stably transfet cells. After

incubation with test compound the hemagglutinin/receptor complex can be immunoprecipitated and western blotted with anti- haemagglutinin antibody. Alternatively, Scatchard analysis of binding assays may be performed with labeled ligand to determine receptor number. The binding assays may be carried out as discussed above

5 and will preferably utilize cells that have been engineered to recombinantly express DRR.

A preferred group of test compounds for inclusion in the DRR expression assay consists of oligonucleotides complementary to various segments of the DRR nucleic acid sequence. These oligonucleotides should be at least 15 bases in length and should be derived from

10 non-conserved regions of the receptor nucleic acid sequence. Sequences may be based upon those shown as SEQ ID numbers 2, 4, 6, 8, 10, 12 or 14.

Oligonucleotides which are found to reduce receptor expression may be derivatized or conjugated in order to increase their effectiveness. For example, nucleoside

15 phosphorothioates may be substituted for their natural counterparts (see Cohen, J., Oligodeoxynucleotides, Antisense Inhibitors of Gene Expression, CRC Press (1989)). The oligonucleotides may be delivered to a patient in vivo for the purpose of inhibiting DRR expression. When this is done, it is preferred that the oligonucleotide be administered in a form that enhances its uptake by cells. For example, the oligonucleotide may be delivered

20 by means of a liposome or conjugated to a peptide that is ingested by cells (see e.g., U.S. Patent Nos. 4,897,355 and 4,394,448; see also non-U.S. patent documents WO 8903849 and EP 0263740). Other methods for enhancing the efficiency of oligonucleotide delivery are well known in the art and are also compatible with the present invention.

25 Having now described the invention, the same will be more readily understood through reference to the following Examples which are provided by way of illustration and which are not intended to limit the scope of the invention.

**EXAMPLES****Example 1: Cloning of Rat DRR-1**

Isolation of cDNA fragment.

5

Degenerate oligonucleotides were synthesized to highly conserved regions of G-protein coupled receptors (transmembrane spanning domains 2 and 7) with the following nucleotide sequences:

10 5' GG CCG TCG ACT TCA TCG TC(A/T) (A/C)(T/C)C TI(G/T) CI(T/C) TIG  
C(A/C/G/T)G 3' (TM2:sense) SEQ ID NO:15; and

5' (A/G)(C/A/T)(A/T) (A/G)CA (A/G)TA IAT IAT IGG (A/G)TT 3'  
(TM7:antisense) SEQ ID NO:16.

15

Poly A+ mRNA was isolated from cultured fetal rat dorsal root ganglia (Sprague-Dawley). The mRNA was reverse transcribed using the First Strand cDNA Synthesis kit (Pharmacia Biotech), subjected to an amplification reaction by polymerase chain reaction (PCR) using Ampli-Taq DNA (Perkin-Elmer Cetus) polymerase under the 20 following conditions: 3 minutes at 94 °C, 40 cycles of 1 minute at 94 °C, 45°C and 72 °C. A cDNA PCR fragment corresponding to approximately 650 bps was isolated and subcloned in pGEM-T-vector (Promega Corporation). The nucleotide sequence of the recombinant clone was determined using the T7-dideoxy chain termination sequencing kit (Pharmacia Biotech) and was found to be unique based upon searches of Genbank/EMBL 25 databases.

The full length rat DRR-1 sequence was obtained from rat genomic DNA using the 650 base pair fragment and the "Promoter Finder DNA Walking kit" (Clontech, cat # K1806-1). This kit contains five libraries of uncloned, adaptor-ligated genomic DNA fragments. The 30 procedure involves two consecutive PCR reactions. Both reactions were done using the

"Advantage Tth Polymerase Mix" also obtained from Clontech, following the conditions recommended by the vendor. The first PCR reaction was performed with the outer adaptor primer (AP1) provided in the kit and an outer, gene-specific primer (GSP1) derived from the sequence of the DRR-1 PCR fragment. The primary PCR mixtures were diluted and used as a template for the secondary (nested) PCR reaction with the nested adapter primer (AP2) and a nested gene specific primer (GSP2). To obtain the sequence of the rat DRR-1 gene upstream of the sequence of the original PCR fragment, the following oligonucleotides were used:

10 GSP1: oligo YF3B59-B, 5'-CGCAGATGAGGTAGTACAGCATCAC SEQ ID NO:17  
GSP2: oligo MML-R1, 5'- CTGTGAGAGAGATGGTAACATACAG SEQ ID NO:18

15 From the first library, a fragment AP2-MMLR1 of 1.9 Kb was obtained and from the third library, a fragment of approximately 1.0 Kb was obtained. To identify the sequence downstream of the known sequence, the following primers were used:

20 GSP1: oligo YF3B59-F2, 5'-GCATCCTGACTGGTTCTTCAG SEQ ID NO:19  
GSP2: oligo MML-F1, 5'- GGGTGAGACTCATCATCATTGTGG. SEQ ID NO:20

25 A fragment MMLF1-AP2 of approximately 1 Kb was obtained from the first library and a fragment of about 600 bp was obtained from the third library. The composite sequence of 1154 nucleotides containing the complete predicted open reading frame of DRR-1 is shown in Figure 1. The open reading frame codes for a 337 amino acid protein (Figure 2) with a predicted molecular mass of 38.7 kD. The protein sequence contains all the characteristic features of G protein-coupled receptors: seven hydrophobic helices likely to represent transmembrane domains, potential glycosylation site at the N-terminal extracellular domain (position 30) and a conserved NPXXY sequence at position 285-289.

Example 2: Cloning of Human DRR Receptor Genes

Two approaches were used to identify and clone novel human DNA sequences homologous and/or related to the rat DRR-1 gene. First, a human genomic library was 5 screened in the lambda vector, Fix II, (Stratagene Cat.# 946203). Approximately 106 human genomic clones were plated and transferred onto nitrocellulose membranes for hybridization with the full length, 32P labeled, rat DRR-1 sequence as a probe. The hybridization was performed at 42 °C, overnight. The filters were washed at room 10 temperature at low stringency (1X SSC/ 0.1% SDS) to allow detection of related but not necessarily identical sequences.

The inserted human DNA present in positive phages was amplified by PCR using the "Expand PCR kit" from Boehringer-Mannheim under conditions allowing accurate 15 amplification of very large fragments of DNA. These long fragments of DNA were digested with various restriction enzymes and subcloned into a plasmid vector. The portions of these clones which hybridized with the rat DRR-1 gene probe were sequenced using the ABI cycle sequencing kit.

A second approach to identifying novel human sequences related to DRR-1 involved the 20 use of the polymerase chain reaction (PCR), performed on total human genomic DNA. Primers were synthesized based upon the human genomic clones described above and were as follows:

25 HML.H, 5'-GCAAGCTTCTGAGCATGGATCCAACCGTC, SEQ ID 21 and  
HML.Bg, 5'-CCCTCAGATCTCCAATTGCTTCCGACAG, SEQ ID NO:22.

Amplification resulted in fragments of approximately 1 kilobase containing the entire 30 coding sequence of the human genes. These fragments obtained were subcloned into the pGEM-T (Promega) vector for DNA sequencing analysis.

Using the above strategies, six human clones were isolated:  
clone 7, SEQ ID numbers 3 and 4;  
clone 18, SEQ ID numbers 5 and 6;  
clone 23, SEQ ID numbers 7 and 8;  
5 clone 24, SEQ ID numbers 9 and 10;  
clone 36, SEQ ID numbers 11 and 12; and  
clone 40, SEQ ID numbers 13 and 14.

None of these clones contain introns and their alignment may be seen in Figure 3.

10

At the amino acid sequence level, the rat DRR-1 clone is 47% to 49% identical to the human clones.

15 At the nucleic acid level, the rat DRR-1 clone is 56% to 58% identical to the human clones. The level of sequence identity within the human clones (7, 18, 23, 24, 36, 40) is very high, between 77% and 98% at the amino acid sequence level. All the human sequences were used as queries to search for homologies in public databases (Genbank, Swissprot, EST). No identical sequences were detected. The closest matches were to members of the mas oncogene family of proteins. The overall amino acid sequence 20 homology between rat DRR-1 and any of the isolated human genes varied from 47 to 50 %. However some stretches display a much higher level of sequence homology, particularly the regions encoding the putative transmembrane domain III and VII (TM3 and TM7) and the intracellular loops 2 and 3 where the homology between the rat sequence and its human homologue is around 80%.

25

#### Example 3: In Situ Hybridization Experiments

Preparation of Tissue: Adult male Sprague-Dawley rats (~300 gm; Charles River, St-Constant, Quebec) were sacrificed by decapitation. Brain and spinal cord with dorsal root ganglia attached were removed, snap-frozen in isopentane at -40°C for 20 s and stored 30 at -80 °C. Frozen human brain, spinal cord and dorsal root ganglia were obtained from the

Brain and Tissue Bank for Developmental Disorders, University of Maryland at Baltimore, according to the strictest ethical guidelines. Frozen tissue was sectioned at 14  $\mu$ m in a Microm HM 500 M cryostat (Germany) and thaw-mounted onto ProbeOn Plus slides (Fisher Scientific, Montreal, Quebec). Sections were stored at -80°C prior to in situ hybridization.

**Synthesis of Riboprobes:** The plasmid pGemT-3b32 GPCR was linearized using either SacII and Not I restriction enzymes. Sense and antisense DRR riboprobes were transcribed in vitro using either T7 or SP6 RNA polymerases (Pharmacia Biotech), respectively in the presence of [<sup>35</sup>S]UTP (~800 Ci/mmol; Amersham, Oakville, Ontario). The plasmid pGemT-Clone 36 GPCR was linearized using SacII and Pst I restriction enzymes. Sense and antisense Clon36 riboprobes were transcribed in vitro using either SP6 or T7 RNA polymerases (Pharmacia Biotech), respectively in the presence of [<sup>35</sup>S]UTP. Following transcription, the DNA template was digested with DNase I (Pharmacia). Riboprobes were purified by phenol/chloroform/isoamyl alcohol extraction and precipitated in 70% ethanol containing ammonium acetate and tRNA. Quality of labeled riboprobes was verified by polyacrylamide-urea gel electrophoresis.

**In situ Hybridization:** Sections were postfixed in 4% paraformaldehyde (BDH, Poole, England) in 0.1 M phosphate buffer (pH 7.4) for 10 min at room temperature (RT) and rinsed in three changes of 2X standard sodium citrate buffer (SSC; 0.15 M NaCl, 0.015 M sodium citrate, pH 7.0). Sections were then equilibrated in 0.1 M triethanolamine, treated with 0.25% acetic anhydride in triethanolamine, rinsed in 2X SSC and dehydrated in an ethanol series (50-100%). Hybridization was performed in a buffer containing 75% formamide (Sigma, St-Louis, Mo), 600 mM NaCl, 10 mM Tris (pH 7.5), 1 mM EDTA, 1X Denhardt's solution (Sigma), 50 (g/ml denatured salmon sperm DNA (Sigma), 50 (g/ml yeast tRNA (Sigma), 10% dextran sulfate (Sigma), 20 mM dithiothreitol and [<sup>35</sup>S]UTP-labeled cRNA probes (10 X10<sup>6</sup> cpm/ml) at 55°C for 18 h in humidified chambers. Following hybridization, slides were rinsed in 2X SSC at RT, treated with 20 (g/ml RNase IA (Pharmacia) in RNase buffer (10 mM Tris, 500 mM NaCl, 1 mM EDTA, pH 7.5) for 45

min at RT and washed to a final stringency of 0.1X SSC at 65 °C. Sections were then dehydrated and exposed to Kodak Biomax MR film for 21 days and/or dipped in Kodak NTB2 emulsion diluted 1:1 with distilled water and exposed for 4-6 weeks at 4°C prior to development and counterstaining with cresyl violet acetate (Sigma).

5

**Results:** Of all regions examined within the neuraxis of the rat, DRR-1 mRNA was exclusively expressed in dorsal root ganglia. High resolution emulsion autoradiography showed accumulations of silver grains exclusively over small and some medium size neurons. This unique and highly restricted distribution pattern for DRR-1 was confirmed in 10 the rat embryo. Sagittal section of an E17 rat fetus showed that DRR-1 mRNA is confined to DRGs. All other structures of the rat embryo were devoid of any specific hybridization signal reinforcing the highly selective nature of DRR-1 expression

15 The expression of human Clone 36 receptor was present in human fetal dorsal root ganglia but not in spinal cord. Specific hybridization signal for Clone 36 was not detected in any of the human adult CNS tissues examined thus far. These include spinal cord, cortex, hippocampus, thalamus, substantia nigra and periaqueductal gray (data not shown). Presence of Clone 36 mRNA in adult DRGs remains to be examined. Standard controls in 20 which additional spinal cord with DRG sections were hybridized with rat DRR-1 antisense or Clone 36 sense 35S-labeled probes displayed no specific hybridization signal.

#### Example 4: Northern Blots

Commercial rat and human multiple Northern blots containing 2 g of polyA RNA from 25 various tissues (Clontech) were used to determine the expression and distribution of the rat DRR-1 message and its human homologues. Radioactively labeled probes were prepared as follows: twenty five ng of a 650 bp 3b-32 PCR fragment derived from rat DRR-1 (see Example 1) or human clone 36 were random-prime labeled using the Ready-to-Go DNA labeling kit (Pharmacia Biotech) and [32P]CTP (3000 Ci/mmol/Amersham). The blot was prehybridized for 1 hour at 68 °C using Expresshyb (Clontech) followed by hybridization 30 (2X10<sup>6</sup> cpm/ml of probe) for one hour using the same conditions. Blots were washed at

room temperature in 2X SSC, 0.05% SDS for 30 min. followed by 3x washes in 0.2X SSC, 1 % SDS at 50 °C for 60 min. and exposed at -80 °C to Kodak Biomax film for 6 days.

- 5   **Expression and Distribution of rat DRR-1:** All the rat tissues studied (heart, brain, spleen, lung, skeletal muscle, kidney and testis) were negative for the expression of DRR-1 following 2 weeks exposure whereas rat genomic Southern analysis revealed a 1.1 kb band when probed with the same cDNA fragment.
- 10   **Expression and Distribution of Human Clone 36:** Northern blots containing RNA from various human tissues were probed with a radio-labeled DNA fragment from clone 36. All the human tissues studied (human fetal brain, lung, liver and kidney and adult human cerebellum, cerebral cortex, medulla, occipital pole, frontal lobe, temporal lobe, putamen, spinal cord, amygdala, caudate nucleus, corpus callosum, hippocampus, total brain, 15 subthalamic nucleus and thalamus) were negative for the expression of this receptor following 2 weeks exposure.

Example 5: Calcium Signaling in Response to Angiotensin I-III

20   The coding sequence of human clone 24 was transferred into a pcDNA3 vector and modified to add a haemagglutinin tag at the C-terminus of the receptor sequence. This clone, designated as pcDNA3-HML-HA24 was transfected into HEK293 cells using a modified CaCl<sub>2</sub> method (Maniatis, Molecular Cloning: A Laboratory Manual, Cold Spring Harbor Laboratory Press (1989)). The cells were maintained in culture medium at 37 °C, 5% CO<sub>2</sub> and diluted 10 fold every 3 days.

25   The cells were inoculated in 90 mm tissue culture dishes (5 x 10<sup>5</sup> cells per flask) in Dulbecco's Modified Essential Medium (DMEM, Gibco BRL), supplemented with 10% fetal bovine serum (FBS), 100 U/ml penicillin, 100 µg/ml streptomycin and 0.25 µg/ml fungizone. One day after inoculation, cells were transiently transfected with 30 µg of 30 plasmid DNA per dish. The cells were harvested 48 hours post transfection for analysis.

The expression of the gene was first checked by immunoprecipitation and western blotting with an anti-haemagglutinin antibody. A protein of approximately 43 KD was detected in stably as well as transiently transfected HEK293 cells, but not in control cells.

- 5     Stably transfected HEK293 cells were obtained after approximately 21 days of selection in culture medium containing 800 µg/ml G418. Calcium signaling measurement was performed with one of these stably transfected cell line, 293/pcDNA3-HML-HA24. The cells were grown on a 24 mm round glass cover slides to 50-70% confluence. After rinsing the cells with 1.8 NBS buffer (135 mM NaCl, 5 mM KC1, 1.2 mM MgCl<sub>2</sub>, 1.8 mM
- 10    CaCl<sub>2</sub>, 5 mM glucose and 10 mM HEPES, pH 7.3), the cells were incubated for one hour at room temperature in the presence of 0.5 ml of 3.5 µM FURA-2 AM (Molecular Probe, F-1221) diluted in 1.8 NBS. The cells were then rinsed three times with 1.8 NBS and incubated for a further 30 minutes at room temperature. The calcium displacement was measured using a PTI (Photon Technology International) D104 photometer equipped with a
- 15    PTI Delta RAM High speed multiwavelength illuminator, a PTI SC500 Shutter controller, a PTI LPS220 ARC lamp supply and the PTI FELIX software, v.1.2. Groups of 2 to 8 cells were chosen and isolated with the photometer diaphragm. The cells were exposed to 340 and 380 nm light and the 510 nm light emitted by the cells was recorded. Angiotensin I, II and III, were added successively - in various order from one experiment to the next -
- 20    followed by bradykinin as a positive control. Upon stimulation with angiotensin II and angiotensin III, a significant response was obtained. Addition of angiotensin I produced no response.

All references cited herein are fully incorporated by reference. Having now fully described the invention, it will be understood by one of skill in the art that the invention may be performed within a wide and equivalent range of conditions, parameters and the like, without affecting the spirit or scope of the invention or any embodiment thereof.

**INDICATIONS RELATING TO DEPOSITED MICROORGANISM  
OR OTHER BIOLOGICAL MATERIAL**

(PCT Rule 13bis)

A. The indications made below relate to the deposited microorganism or other biological material referred to in the description on page <u>6</u> line <u>8-9</u>	
B. IDENTIFICATION OF DEPOSIT	
Name of depository institution Deutsche Sammlung von Mikroorganismen und Zellkulturen GmbH (DSMZ)	
Address of depository institution (including postal code and country) Mascheroder Weg 1b D-38124 Braunschweig Germany	
Date of deposit 27 November 1997	Accession Number DSM 11877
C. ADDITIONAL INDICATIONS (leave blank if not applicable)	
In respect of all designated states in which such action is possible and to the extent that it is legally permissible under the law of the designated state, it is requested that a sample of the deposited micro-organism be made available only by the issue thereof to an independent expert, in accordance with the relevant patent legislation, e.g. Rule 28(4) EPC, and generally similar provisions <i>mutatis mutandis</i> for any other designated state.	
D. DESIGNATED STATES FOR WHICH INDICATIONS ARE MADE (if the indications are not for all designated States)	
E. SEPARATE FURNISHING OF INDICATIONS (leave blank if not applicable)	
The indications listed below will be submitted to the International Bureau later (specify the general nature of the indications e.g., "Accession Number of Deposit")	
For receiving Office use only	
<input type="checkbox"/> This sheet was received with the international application	
Authorized officer	
For International Bureau use only

CLAIMS

1. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of rat dorsal root receptor 1 (DRR-1) as shown in SEQ ID NO:1.  
5
2. A substantially pure protein according to claim 1, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:1.
3. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of rat DRR-1 as shown in SEQ ID NO:1.  
10
4. The polynucleotide of claim 3, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:1.
- 15 5. The polynucleotide of claim 4, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:2.
6. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 1 (DRR-1) as shown in SEQ ID NO:3.  
20
7. A substantially pure protein according to claim 6, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:3.
8. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-1 as shown in SEQ ID NO:3.  
25
9. The polynucleotide of claim 8, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:3.

10. The polynucleotide of claim 9, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:4.
11. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 2 (DRR-2) as shown in SEQ ID NO:5.
12. A substantially pure protein according to claim 11, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:5.
- 10 13. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-2 as shown in SEQ ID NO:5.
14. The polynucleotide of claim 13, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:5.
- 15 15. The polynucleotide of claim 14, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:6.
16. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 3 (DRR-3) as shown in SEQ ID NO:7.
- 20 17. A substantially pure protein according to claim 16, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:7.
- 25 18. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-3 as shown in SEQ ID NO:7.
19. The polynucleotide of claim 18, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:7.

20. The polynucleotide of claim 19, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:8.
21. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 4 (DRR-4) as shown in SEQ ID NO:9.
22. A substantially pure protein according to claim 21, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:9.
- 10 23. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-4 as shown in SEQ ID NO:9.
24. The polynucleotide of claim 23, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:9.
- 15 25. The polynucleotide of claim 24, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:10.
26. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 5 (DRR-5) as shown in SEQ ID NO:11.
- 20 27. A substantially pure protein according to claim 26, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:11.
- 25 28. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-5 as shown in SEQ ID NO:11.
29. The polynucleotide of claim 28, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:11.

30. The polynucleotide of claim 29, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:12.
31. A protein, except as existing in nature, comprising the amino acid sequence consisting functionally of human dorsal root receptor 6 (DRR-6) as shown in SEQ ID NO:13.
32. A substantially pure protein according to claim 31, wherein said amino acid sequence consists essentially of the amino acid sequence of SEQ ID NO:13.
- 10 33. A substantially pure polynucleotide encoding a protein comprising the amino acid sequence consisting functionally of human DRR-6 as shown in SEQ ID NO:13.
34. The polynucleotide of claim 33, wherein said polynucleotide encodes a protein consisting essentially of the amino acid sequence of SEQ ID NO:13.
- 15 35. The polynucleotide of claim 34, wherein said polynucleotide has the nucleotide sequence of SEQ ID NO:14.
36. An antibody made by a process comprising the step of injecting a pharmaceutically acceptable preparation comprising the protein of anyone of claims 1, 2, 6, 7, 11, 12, 20 16, 17, 21, 22, 26, 27, 31 or 32, into an animal capable of producing said antibody.
37. An antibody that binds specifically to anyone of the proteins of claims 1, 2, 6, 7, 11, 12, 16, 17, 21, 22, 26, 27, 31 or 32
- 25 38. A vector for expressing rat DRR-1, comprising the polynucleotide of either one of claim 3 or 4.

39. A vector for expressing anyone of

- (i) human DRR-1, comprising a polynucleotide of claim 8 or 9;
- (ii) human DRR-2, comprising a polynucleotide of claim 13 or 14;
- 5 (iii) human DRR-3, comprising a polynucleotide of claim 18 or 19;
- (iv) human DRR-4, comprising a polynucleotide of claim 23 or 24;
- (v) human DRR-5, comprising a polynucleotide of claim 28 or 29;
- (vi) human DRR-6, comprising a polynucleotide of claim 33 or 34.

10 40. A host cell transformed with a vector according to claim 38 or 39.

41. Recombinant rat DRR-1, human DRR-1, human DRR-2, human DRR-3, human DRR-4, human DRR-5, human DRR-6, produced by the host cell of claim 40.

15 42. A method for assaying a test compound for its ability to bind or to activate a G protein-coupled dorsal root ganglia specific receptor (DRR), comprising:

- a) incubating a source containing DRR but substantially free of other G protein-coupled receptors, with
- 20 i) a ligand known to bind to DRR;
- ii) said test compound; and

25 b) determining the extent to which said ligand binding is displaced by said test compound.

(C) STRANDEDNESS: single

20 (D) TOPOLOGY: linear

## (ii) MOLECULE TYPE: other nucleic acid

(A) DESCRIPTION: /desc = 'synthetic PCR primer.'

25 (iii) HYPOTHETICAL: NO

(iv) ANTI-SENSE: NO

## (xi) SEQUENCE DESCRIPTION: SEQ ID NO:15:

30

**SUBSTITUTE SHEET (RULE 26)**

GGCCGTCGAC TTCATCGTCW MYCTIKCIYT IGCNG

35

(2) INFORMATION FOR SEQ ID NO:16:

5

(i) SEQUENCE CHARACTERISTICS:

10

- (A) LENGTH: 15 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: other nucleic acid

(A) DESCRIPTION: /desc = "synthetic PCR primer"

15

(iii) HYPOTHETICAL: NO

(iv) ANTI-SENSE: NO

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:16:

20

RHWRCARTAI ATIAT

15

(2) INFORMATION FOR SEQ ID NO:17:

25

(i) SEQUENCE CHARACTERISTICS:

30

- (A) LENGTH: 25 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

**SUBSTITUTE SHEET (RULE 26)**

(ii) MOLECULE TYPE: other nucleic acid

(A) DESCRIPTION: /desc = "synthetic PCR primer"

5 (iii) HYPOTHETICAL: NO

(iv) ANTI-SENSE: NO

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:17:

10

CGCAGATGAG GTAGTACAGC ATCAC

25

(2) INFORMATION FOR SEQ ID NO:18:

15

(i) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 25 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

20 (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: other nucleic acid

(A) DESCRIPTION: /desc = "synthetic PCR primer"

25 (iii) HYPOTHETICAL: NO

(iv) ANTI-SENSE: NO

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:18:

30

**SUBSTITUTE SHEET (RULE 26)**

CTGTGAGAGA GATGTTAACCA TACAG

25

## (2) INFORMATION FOR SEQ ID NO:19:

5

## (i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- 10 (D) TOPOLOGY: linear

## (ii) MOLECULE TYPE: other nucleic acid

- 15 (A) DESCRIPTION: /desc = "synthetic PCR primer"

15 (iii) HYPOTHETICAL: NO

(iv) ANTI-SENSE: NO

## (xi) SEQUENCE DESCRIPTION: SEQ ID NO:19:

20

GCATCCTTGA CTGGTTCTTC TCAG

24

## (2) INFORMATION FOR SEQ ID NO:20:

25

## (i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 25 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- 30 (D) TOPOLOGY: linear

**SUBSTITUTE SHEET (RULE 26)**

(iii) MOLECULE TYPE: other nucleic acid

(A) DESCRIPTION: /desc = "synthetic PCR primer"

5 (iii) HYPOTHETICAL: NO

(iv) ANTI-SENSE: NO

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:20:

10

GGGTGAGACT CATCATCATT TGTGG

25

(2) INFORMATION FOR SEQ ID NO:21:

15

(i) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 30 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

20

(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: other nucleic acid

(A) DESCRIPTION: /desc = "synthetic PCR primer"

(iii) HYPOTHETICAL: NO

25

(iv) ANTI-SENSE: NO

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:21:

30 GCAAGCTTTC TGAGGCATGGA TCCAACCGTC

30

**SUBSTITUTE SHEET (RULE 26)**

## (2) INFORMATION FOR SEQ ID NO:22:

## (i) SEQUENCE CHARACTERISTICS:

5 (A) LENGTH: 30 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

## 10 (ii) MOLECULE TYPE: other nucleic acid

(A) DESCRIPTION: /desc = "synthetic PCR primer."

(iii) HYPOTHETICAL: NO

## 15 (iv) ANTI-SENSE: NO

## (xi) SEQUENCE DESCRIPTION: SEQ ID NO:22:

CCCTCAGATC TCCAATTTGC TTCCCGACAG

30

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/SE 98/02348

## A. CLASSIFICATION OF SUBJECT MATTER

IPC6: C07K 14/72

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC6: C07K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

SE,DK,FI,NO classes as above

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	WO 9504073 A1 (THE BOARD OF TRUSTEES OF THE LELAND STANFORD JUNIOR UNIVERSITY), 9 February 1995 (09.02.95)	1-35, 38-42
A	--	36-37
X	WO 9405695 A1 (NEW YORK UNIVERSITY), 17 March 1994 (17.03.94), See page 14, line 11 seq 52, claims	1-42
A	--	
A	Dialog Information Service, file 154, Medline, Dialog accession no. 08044093, Medline accession no. 95047685, Brown NJ et al: "Gastrointestinal adaptation to enhanced small intestinal lipid exposure", Gut (ENGLAND) Oct 1994, 35 (10) p 1409-12	1-42
	--	

 Further documents are listed in the continuation of Box C. See patent family annex.

## \* Special categories of cited documents

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search

Date of mailing of the international search report

6 April 1999

14.04.99

Name and mailing address of the ISA/  
Swedish Patent Office  
Box 5055, S-102 42 STOCKHOLM  
Facsimile No. + 46 8 666 02 86

Authorized officer  
Patrick Andersson  
Telephone No. + 46 8 782 25 00
